Such leases and permits may be issued at a price not less than forty cents per acre for a term of twenty years, provided, however, that if more than one application is made for a lease of any area of timber land in the province, the Attorney-General and Commissioner of Crown Lands may, after due public notice thereof, on a given days hour and place to be fully set forth in such public notice, put up the leasing of said lands to public competition, whereupon the lease shall be issued of such timber to the person offering the highest sum per acre therefor.

Persons holding a lease of timberlands shall be entitled to cut all the timber therefrom not less than 10 inches in diameter, and remove the same, and for the purpose of carrying on the cutting and hauling of such timber may erect upon said lands houses, mill, shanties or camps, provided that the erection of such buildings and occupation thereof for a period of twenty years shall not afford any preemption for an absolute grant of such land, but at the expiration of the lease such buildings may be removed from the premises by the lessee, or, if not removed within ninety days from the expiration of the lease, said buildings shall become vested in Her Majesty the Queen.

In case of leases permitting the cutting of timber of less size than 10 inches in diameter and not less than five inches in diameter, the rental shall be not less than fifty cents per acre.

The Governor-in-Council is authorized and empowered to make a lease of Crown Lands upon terms other than is provided in this Act, in cases where the land proposed to be leased are of inferior quality, and the party proposing to lease the same is prepared to spend money in the development of said land, or in the erection of mills and machinery for the manufacture of pulp or other wood products.

The Governor-in-Council may lease to any person, firm or corporation the privilege of erecting dams, sluices, etc., on any stream for the purpose of floating timber down such stream, and the amount to be paid for such right or privilege shall be fixed by the Attorney General and Commissioner of Crown Lands, subject to the approval and revision of the Governor-in-Council.

The Governor-in-Council is hereby authorized and empowered to obtain by purchase at a rate not exceeding twenty-five cents per acre any land heretofore granted for lumbering purposes. Such land may be reconveyed by regular deed from the owners thereof to Her Majesty the Queen. Such deeds shall be duly recorded in the office of the Registrar of Deeds in the county where such lands lie, and thereupon such lands shall become actually revested in Her Majesty the Queen the same as if they had never been granted, and shall be subject to be disposed of as now provided by law, including this Act.

## TRADE NOTES.

The Toronto office of the J. C. McLaren Belting Company has been removed from Bay street to 60 Colborne street. Mr. A. D. McArthur continues as manager.

The attention of our readers is directed to the advertisement in this issue of Messrs. Boynton & Company, manufacturers of embossed and turned wood work. This company are said to be the largest manufacturers and to carry the largest stock in this line on the continent. They will be pleased to furnish one of their catalogues to any reader of the LUMBERMAN who may make request on a postal card. This company have already a considerable trade in Canada, and are desirous of increasing it.

# THE NEWS.

—M. Mansfield is operating a new portable saw mill at Kinmount, Ont.

—A new saw mill firm at Trout Creek, Ont., is Burk, Buckel & Bechtler.

—W. W. Carter, of Fesserton, Ont., is placing a band saw in his mill there.

—Shortreed Bros., of Hillsdale, Ont., have just put in a new shingle machine.

—J. McCutcheon has bought out the lumber yard of A. Clarke at Glenboro, Man.

—Robinson & Co. have purchased the lumber stock of Riley & Wells at West Selkirk, Man.

—Joseph Chochene, of Gracefield, Que., has lately made extensive improvements to his saw mill.

—The Thompson Company will erect a sawmill at Katrine, Ont., with a daily capacity of 30,000 feet.

—Rider & Kitchener have purchased a site at Lindsay, Ont., for their proposed veneer and excelsior factory.

—The death is announced of John Wilson, formerly a millwright in the Royal City mills, New Westminster, B. C.

—Peter Phillips has purchased the planing mill on Pacific ave., Toronto Junction, formerly owned by John Stewart.

—Innes, Hemeon & Co., of Liverpool, N. S., intend building a large steam rotary saw mill in Bristol, opposite that town.

—H. Walters & Sons, axe manufacturers, of Hull, Que., have doubled the capacity of their factory, and in future 150 axes per day will be turned out.

—Humphrey Bowser, of Dorchester, N. B., intends building a sash and door factory, and engaging in the manufacture of sash and doors on an extensive scale.

—The President of the United States has prepared a proclamation setting apart 136,000 acres of land on the south side of Lake Tahao, California, as a forestry reserve.

—The Dominion Bung Company is a new concern in Toronto, manufacturing spiles, taps, compressed and cut bungs, tap ends, etc. They use southern whitewood to a large extent.

—The Ontario Government have decided that the $50,000 appropriated for reforestry will be used in the townships of Palmerston, Barrie, Clarendon, and Abinger, in the counties of Addington and Frontenac.

—Andrew Price has severed his connection with the firm of S. H. White & Co., of Sussex, N. B., and it is said will engage in lumbering operations on his own account in the northern part of New Brunswick.

—The well known saw manufacturers, Shurley & Dietrich, of Galt, Ont., have purchased property adjoining their factory and intend erecting a large building for the incorporation of their works now located at St. Catharines.

—The Royal City Planing Mills Co., of Vancouver, B. C., recently shipped to the Harbor Commissioners at Montreal some fine specimens of Douglas fir. The timber was 36 x 36 inches square, 60 feet long, and 14 x 16 inches tapered, 76 feet long.

—Extensive alterations are being made to the saw mill of the Columbia Lumber Co., at Golden, B. C. Additional machinery and motive power have been put in, necessitating the building of an addition to the mill. The company propose to erect a new office building in Golden.

—The estates of James MacLaren and Ross Bros., at Buckingham, Quebec, are each building burners to dispose of their saw mill refuse. Chas. Kushick's steam mill at same place is in operation, and W. H. Kelly's mill is being overhauled preparatory to making a start.

—Workmen are now engaged preparing the site for the calcium carbide factory to be built adjoining the mill of the Bronson & Weston Lumber Co., in Ottawa. Part of the old saw mill, including two gang saws and a band saw, will be torn away to make room for the new building.

The shingle mill of McLaren & McLaurin, at East Templeton, Que., commenced work for the season a fortnight ago. New additions have been made to the saw mill and boiler house, and a good season is anticipated. Another new saw mill has been built on the Blanche river, near Templeton, by Mr. Perkins.

—The High Commissioner for Canada, London, England, has received an enquiry from a firm of manufacturers of wooden shoes in Belgium who wish to import Canadian basswood suitable for their shoes. The timber must be white, soft and easy to split. Glasgow and London firms desire to secure an agency for Canadian pulp.

—The annual meeting of the St. John River Log Driving Company was held at Fredericton, N. B., on April 5th, when directors were elected as follows: W. H. Murray, St. John, president; J. Fraser Gregory, St. John, secretary-treasurer; A. J. Beveridge, Andover; F. H. Hale, Woodstock; R. A. Estey, Fredericton; H. Hillyard, St. John.

—The Algonquin Milling Company, Ltd., of Algonquin, Ont., has been granted an Ontario charter, to carry on business as grist-millers and saw-millers, and to manufacture cheese boxes, lumber, shingles and other products of wood. M. H. Bissell, R. A. McLellan, and James Bissell, of Brockville, and C. H. Bissell and J. B. Bissell, of Yeoman, are provisional directors.

—The Timber Inspector for British Columbia gives the following statement of timber and cordwood cut during the eleven months ended November 30th, 1898, (not including that from Dominion lands, nor from the Esquimalt and Nanaimo railway lands): On crown lands, 70,755,866 feet; on timber leasehold, 42,181,178 feet; on private property, 11,598,614 feet; total, 124,546,658 feet.

—A deputation of lumbermen, including Angus McLeod, of Bracebridge, W. J. Sheppard, of Waubaushene, T. Sheppard, of Orillia, T. Irwin, of Peterboro, and A. McCormack, of Orillia, recently asked the Commissioner of Crown Lands for a rebate of between $3,000 and $4,000, claimed to have been paid as overcharged timber dues. It appears that the Sheppard-Irwin Lumber Company paid dues, as customary, upon the cut of logs as estimated by the cullers, but in manufacturing the amount of lumber proved to be less than was claimed.

—The Rathbun Company, of Deseronto, have this spring made extensive improvements to some of their mills. At the Lindsay mill a new 100 h.p. boiler from the Polson Company, Toronto, has been put in, together with a twin-engine rope feed plant, designed to operate a new circular saw carriage and frame, supplied by The Wm. Hamilton Manufacturing Co., of Peterboro. The old boiler will be used exclusively to supply steam to the twin-engine operating the rope feed. The spring drive of logs will not arrive at the mill before the 1st of June, but a supply of logs has been purchased from farmers to keep the mill running until that date. The local manager, Mr. G. H. M. Baker, states that from 85 to 100 men will be employed during the season, and that the mill will run day and night for at least three months. At the Deseronto mill a cement foundation 15 inches thick has been placed under one of the Wickes gang saws. All the slash tables have been rebuilt, and a new slab transfer put in. About 125 men will be employed at this mill.

## CASUALTIES.

—P. J. Sullivan had one of his arms cut off by a buzz saw while working in Farrell's mill at Low, Que.

—James Yale had three fingers completely severed by coming in contact with an edging saw in the mill of N. S. Lusty & Sons at Rodney, Ont.

—Duncan Campbell, employed in J. S. Findlay's saw mill at Owen Sound, Ont., was struck on the head by a board which flew from the saw, and died from the injuries received.

—John Batley, proprietor of a saw mill at McKellar, Ont., went down to the mouth of the Seguin river to take the stoplogs out of the dam. While thus engaged he was precipitated into the water just above the dam and drowned.

## PERSONAL.

Mr. C. S. Ayer, until recently bookeeper with T. B. Calhoun, Moncton, N. B., has removed to Bangor, Maine, to accept a position with F. W. Ayer & Co., lumber merchants.

Mr. F. W. Jones, assistant manager at Winnipeg for the C. P. R., has tendered his resignation, to accept the appointment as secretary-treasurer of the Columbia River Lumber Company, of Golden, B. C.

It is with pleasure that we note that Lieut. C. M. Dobell, of the Royal Welsh Fusiliers, and a son of Hon. R. R. Dobell, timber merchant, of Quebec, has been given brevet rank of major and promoted to the rank of captain in recognition of his services during the occupation of Crete. Brevet promotion is not given in the army to officers uuder the rank of captain.

The CANADA LUMBERMAN received a pleasant call a fortnight ago from Mr. C. H. O. Houghton, travelling representative for Geo. D. Perry, wholesale dealer in mahogany, cedar and veneers, Chelsea, Mass. Mr. Houghton visits Canada three or four times each year, calling upon the piano manufacturers and other users of veneers. He went over to Buffalo on the 15th inst., to participate in the ceremonies in connection with the Hoo-Hoo Concatenation.

In the annual special issue of the Timber Trades Journal, we observe a portrait of Mr. James Davidson, of the wood-working firm of Davidson & Thackray, of Ottawa. Of Mr. Davidson our contemporary says: Mr. Davidson was born in the city of Ottawa forty years ago, and when only eleven years of age commenced work in a shingle mill. In 1874, when Mr. R. Thackray started in the sash, door and blind business, Mr. Davidson threw in his lot with him. They then manufactured by hand power. In 1877 Mr. Davidson came to England, and he is proud of the honor of being one of the first to introduce Canadian doors to the English people. He remained in England seven years, making Liverpool his headquarters, and amongst the timber merchants of that city he made many friends. He returned to Canada in 1885 and, shortly after, the firm purchased their present premises, which is situated in the heart of Ottawa. The factory is one of the most up-to-date establishments in the Dominion. Mr. Davidson is an alderman in the city, and is chairman of the Board of Works. In the last municipal election he had the great honor of being returned by the largest vote ever polled by an Aldermanic candidate in the history of the City of Ottawa. His business and his civic duties by no means debar him from his love for sport.

# WOOD PULP DEPARTMENT

## THE PROCESS OF MANUFACTURING MECHANICAL WOOD PULP.*

By W. A. HARE.

(Continued from April issue.)

METHOD OF CLEANING SCREENS.—It is important that the screen plates should be kept clean. When it is found that it is difficult to get the stock to pass through, the plates should be examined, and if gummed up or clogged, they can be cleaned as follows: Wet the plates thoroughly with parafine or coal oil, and with a beater, made out of an old piece of felt, beat or whip the plates. The oil dissolves the pitch and gum, and the beater will free the cuts of whatever is there. Whip the plates afterwards with water, and, if properly done, the plates will regain their capacity. When the stock is not ground well, being either full of slivers or uneven in grain, it is difficult to get the screen to pass it sufficiently fast. The wet machine tender has constantly to scrape the screen plates, removing the larger pieces which stop up the slits. There is no remedy for this but more care in grinding. By putting a centre board nearly the whole length of the screen and supplying the stock at one end, allowing it to flow down one side, around the end of the board, and up the other side, the screen will, to a great measure, clear itself, and therefore will require less attention.

ARRANGEMENT.—The general arrangement is to have one screen for each wet machine, to which it is connected direct. There is an advantage in having another pine trough, into which the screens discharge, and from which the wet machines are supplied. In the case of an accident to a screen, or if it should require cleaning, it is evident that with one trough the wet machine cannot run. If, however, the wet machine is supplied from a second trough, it can get its stock from the other screens, and the output is kept up. Suppose, for example, No. 1 wet machine breaks down, and also No. 3 screen is changing plates, or otherwise cut out; by means of the two troughs No. 3 wet machine can be supplied from No. 1 screen, with the result that only one set is inactive, whereas in the other case two complete sets would be idle. The extra pine trough does not cost much, and may in this way save many times its cost in increased output. There are, perhaps, some objections to this method, but they all can be easily met. It will be found necessary to set the line of screens somewhat higher than the wet machine floor, to allow passage room under the second trough. In an existing mill this would be out of the question, but in designing a new plant it offers no serious difficulty. If found necessary, an extra screen could be installed, which will serve as a spare one in case of accident, or can be connected in when the stock is coming heavier than usual. With an easy load on the screen it does better work and requires hardly any attention from the wet machine man. If the capacity is limited or the supply of stock irregular, it must be constantly looked after, and at a time when the man can least spare the time.

### WET PRESSING.

DESCRIPTION OF WET MACHINE.—Fig. 11 is an illustration of a wet machine manufactured by the Jenckes Machine Company. It is a very good machine in design and workmanship. The main frame is cast iron of the usual web and flange construction. The standards are bolted to the main frame and reinforced by tension rods, which can be removed when necessary. The lower press roll is of hardwood turned up true. The top press roll is made of cast iron, turned and polished, and is very heavy. The usual hand wheels and pressure springs are employed to give sufficient pressure to the felt as it passes between the two press rolls. These screws also serve to lift the top roll, when necessary, by means of the forged links shown in cut. The doctor, or knife, is slung from the top roll bearings, and is furnished with a steel blade, a spring for throwing it out of contact with the roll, and a handle for operating it. Small wood rolls are provided to direct the felt in its path, the front one being a stretch roll by which the slack is taken up, giving it the right tension. The two rolls shown close together, one above the other, in the cut, are the squeeze rolls, whose duty is to remove some of the water from the felt after it leaves the beater. The top roll is the felt guide roll, by which the felt is kept running in the centre of the machine. The back roll of all is the couch roll, which is made of iron covered with a ¾-inch of soft India rubber. Some makers still use the wooden couch roll, wrapped with felt, but the rubber roll is much cleaner, neater, requires no attention or cleaning, and does better work all round. It is supplied with this machine when desired. The duty of this roll is to pick up the pulp on the felt from the cylinder mould. To keep the felt clean and able to carry the supply of stock, a beater and spray pipe are provided. The beater consists of a shaft carrying three short-armed spiders connected by hardwood strips. In revolving, the strips strike the felt on one side, while the spray washes it from the other. This not only cleans the felt, but whips up the hair on its surface, increasing its carrying capacity. A suction box

* Paper read before the Engineering Society of the School of Practical Science, Toronto, and published by permission.

is provided for extracting as much of the water from the felt and pulp as possible before it passes between the press rolls. The box extends the whole width of the felt, and is tightly closed up, except the top, where it is perforated with small holes. A pipe connects this box with the draft tube of the water wheels, or to a power-driven suction pump. As the felt passes over the box the water is sucked down into it, leaving the felt much drier. In large mills where there are many wet machines running, it is by far the best method to connect the suction or draft boxes with a power-driven suction pump, as any considerable amount of air let into the draft tubes of the water wheels means a loss of head, which is very expensive when it means a decreased output. The vat is made of 3-inch pine bolted together, and provided with sprays as usual. The cylinder mould, which revolves in the vat, consists of a number of brass spiders mounted on a shaft, and covered with brass wire cloth. It is driven by contact with the couch roll. The felt, in its path, passes the stretch roll in front of the machine, goes down under the two rolls near the floor, up past the beater and cleaning sprays, through the squeeze rolls and back under the couch roll. From here it passes over the guide roll, past the suction box and through the large press rolls, and so back to the stretch roll in front.

Fig. 12 shows the interior of the Chicoutimi Pulp Company's wet machine room. This is the usual arrangement of wet machines in either large or small mills. The machines are driven from a main shaft supported by the roof trusses. In the right foreground is shown the hydraulic press, which is used to force some of the water from the pulp. The screens and pulp trough are placed back of the wet machines. There are eight wet machines installed in this mill, handling about 90 tons of wet pulp per day.

Operation.—The pulp and water, as it comes from the screen, passes to the vat of the wet machine. In this vat revolves the cylinder mould. The vat and mould are so designed that the water cannot flow out of the vat until it has passed through the meshes of the wire covering on the mould; or in other words, the outlet of the vat is led from the inside of the mould. The pulp, being in suspension in the water, cannot pass through, and is spread in a thin layer over the surface of the mould, which, by its revolution, carries the pulp up under the couch roll, and in connection with the running felt. The pulp, on contact with the felt, fastens itself thereon, leaving the wire comparatively clean. By the motion of the felt the pulp is carried over the machine, and, after going over the suction box, where a certain amount of the water is drawn off, it passes between the large press rolls. These rolls being very heavy, and also being pressed together by the powerful springs, force out much of the water. The pulp on coming through leaves the felt and sticks to the top roll, where it is allowed to accumulate by the addition of a number of layers. When it has arrived at a proper thickness, it is cut off. There are two methods of removing the pulp from the top roll. One is by means of a short sharpened pin made of hardwood. The operator sticks the point of the pin under the pulp, and by a quick motion across the face of the roll cuts a gash in pulp the whole width of the machine. By grasping the lower edge and allowing the roll to make one revolution, the sheet falls free in his hands. The other method is by use of a doctor and knife, such as is shown in Fig. 11. The machine hand, in this case, simply presses on the handle, which brings the knife against the roll, severing the pulp. The sheet unrolls as before, and is thrown on the table and folded. The first method has many objections to it, aside from the difficulty of cutting a straight edge. A workman, if he is in any way nervous, is apt to stick the pin into the felt, which completely ruins it.

When the pulp is coming very fast and is allowed to roll up too thick, the workman may not be able to drive the pin across the roll at one sweep. On making a second attempt the roll has advanced, and there is great danger of his dropping the pin over the roll. It is now certain to pass between the press rolls, cutting a hole in the felt and ruining the fibre of the under roll. Numbers of felts have been needlessly spoilt in this manner, as the injury could have been prevented by the use of a knife. With the doctor the heaviest layers can be cut off as easily as the lighter ones. The knife is apt to crinkle up the edge of the sheet, but this disadvantage is partly offset by the straight edge obtained. The sheet is folded so that there are no edges showing from the outside, making, when folded, a bundle about 24″ × 18″ × 8 layers thick. The sheet from a 16-inch roll will be 50 inches wide, the length depending on the width of the machine. The standard width adopted by most builders of wet machines is 72 inches, which is large enough. If larger than this there would be difficulty in throwing the sheet.

The pulp vat at the back of the machine is provided with inlet and discharge valves or gates, by which the wet machine man can regulate the level of the water in it. When the stuff pump is driven from the grinder shaft, the variations in its speed may cause considerable difficulty in keeping the water level constant. No trouble will be found in doing this if the variations in the speed of the stuff pump are small. When the wire of the cylinder mould gets dirty or gummed up, its capacity is limited considerably. It may be cleaned by rubbing with coal oil and playing upon it with a spray of water. Situated close to the wire gauze is a brass pipe into which have been drilled a number of fine holes. It is supplied by the low pressure system before mentioned. The spray is allowed to play upon the wire of the cylinder mould, keeping it comparatively clean.

The life of a felt varies considerably with the treatment it has received and the quality of its manufacture. The gray Canadian felt is a better one to carry the stock, and will last longer than the white American ones. When a felt is new, the carrying capacity, at a speed of 50 feet per minute, is about 5½ tons dry per 24 hours, and will

sometimes exceed this output under favorable circumstances. The usual daily capacity of the felt is about 5 tons of dry pulp per day. The output will fall below this, however, when the felt is worn.

HANDLING PULP.—When the pulp is cut from the wet machine roll, it is thrown on a table placed behind the operator, upon which it is folded. This table is made of heavy boards, and is about 7 feet 8 inches long by 3 feet 6 inches wide. When the sheet is thrown, a portion of it is folded in, to give the operator a better hold. This makes the sheet taken from a 16-inch roll to be about 3 feet 6 inches wide by 6 feet long. The extra length in the table is for the purpose of piling the pulp on until it is taken to the hydraulic presses.

Though it seems to be the general practice to erect the hydraulic press in the wet machine room, an advantage might be gained, especially if the output of the mill exceeds 20 tons dry per day, by placing the hydraulic press, baling press, together with their pumps, etc., in a room by themselves. If this method is adopted, a very convenient way of carrying the wet pulp from the wet machine tables to the tables in the hydraulic press room is by means of a small trolley running back of the line of tables at the wet machines, and sufficiently near to them to allow the pulp to be easily transferred to the trolley. If the mill were an exceptionally large one, making it difficult to keep the long line of tables clear, a cheap cable drive could be installed for moving the loaded trolley. By arranging a small lever and grip, so that the trolley could be easily started by throwing the lever to the right, and reversed by making a similar movement to the left, the carrying of a large amount of pulp would present no serious difficulties.

(To be Continued.)

It is stated that a company has been formed by Mr. John Mather, of Ottawa, to erect pulp and paper mills on Tunnel Island, near Rat Portage, Ont.

It is rumored that several newspaper publishers in the United States are considering the question of building pulp and paper mills in the vicinity of Ottawa, Ont. Mr. J. L. Whitcomb, of New York, has been in Ottawa recently, and will probably recommend the location of a large mill at Britannia.

# IMPROVED CHAMPION DOUBLE EDGER

**All Manufacturers are forced in these days of sharp competition to invest in up-to-date Machinery, increasing the output per man, thus lowering the cost of production—Lumbermen are no exception to this rule.**

## THIS IMPROVED DOUBLE EDGER

s made in three grades—Light, Heavy and Extra Heavy. **Press and Feed Rolls** are of large diameter. Feed rolls fluted, bearings adjustable, front press rolls made in sections, both front and back hung in stiff open frames LIFTING WITH FEED NOT AGAINST IT—a new and important feature—ADJUSTABLE BOTH WAYS FOR ALIGNMENT WITH MANDREL. Rolls sufficiently large to be used for return of stock over edger, and still view of saws is not obstructed—all have bridgetree quickly removable to take off saws—Saws are moved by guides and guides are removable to take off Saws.

**The Light Champion Edger** has strong box frame cast in one piece, supported with four legs. Mandrel, 2 7-16 steel supported on two long bearings.

No. 1 Champion has two Saws, one movable; range between Saws from 1¾ to 22 inches.

No. 2 Champion has three Saws, two movable; range between stationary and first movable Saw, 1¾ to 18¾ inches, and between movable Saws 4 inches.

Both are provided with front tables, with 4½" rolls and guide, movable with lever up to 4 inches inside of stationary Saw.

**The Heavy Champion Edger** shown in illustration has heavy box frame supported on six legs. 2⅞ steel mandrel supported in three bearings of ample proportion, reducing the pressure to the square inch of wearing surface to a minimum, permitting the greatest speed.

The Pulley is carried between two heavy bearings cast in one solid box-shaped frame.

Front and Back Press Rolls arranged as in the Light Edger, are carried in box-shaped uprights connected and braced together to prevent springing and twisting of frame.

No. 3 Heavy Champion has 3 Saws, 2 movable; range between stationary and movable Saws 1¾ to 24¾", and third Saw 4" from second.

No. 4 Champion range is 1¾" to 28¾", and third Saw 4" from second.

No. 5 Champion range is 1¾" to 36¾", and third Saw 4" from second.

A fourth Saw can be added to these Heavy Edgers, reducing the extreme opening 4".

**The Extra Heavy Champion Edger** has a box frame in appearance much the same as the Heavy Edger.

No. 6 Champion has 3 7-16 mandrel, with 5 Saws—2 stationary, 3 movable—divided press rolls, for two men to edge at once; two movable guides on front table. Greatest width between first and second Saws, 34 inches.

No. 7 Champion has 3⅞ steel mandrel, with 6 Saws, and otherwise same as No. 6.

## THE EXPLOITS LUMBER COMPANY.

Canadian capitalists have recently been attracted to Newfoundland as a promising field for investment. One of the foremost companies now engaged in developing the lumbering industry is the Exploits Lumber Company, which controls about eight hundred thousand acres of timber lands situated in the Exploits Valley, through which runs the Exploits river, the largest in Newfoundland. The North-Western Railway also extends nearly the entire length of the valley, and for about fifty miles through the limits of the above company.

The mill of the Exploits Lumber Company is situated at Botwoodville. Recently it has been remodelled and equipped with modern machinery and appurtenances, and is now up-to-date in every respect. The upper or log floor of the mill comprises block gang, rotary and re-saw, lath and shingle machines, edgers, trimmers, steam feed and steam canters. In connection with the mill there is a fully equipped machine shop, the whole being under the superintendence of Mr. John McLean, late of New Brunswick, one of the most expert millwrights of the day.

Live rolls are employed for conveying the lumber to each machine, from which it is carried on surveyors and classers to the particular pile for which it is intended, where it is lifted from the rollers for the first time since leaving the gang saw. The refuse is carried to burner in sluices, through which run endless chains.

It is estimated that the limits of this company contain from one hundred to two hundred and fifty million feet of white pine timber, and an average of forty cords of pulpwood per acre. Their annual cut is about ten million feet, chiefly white pine. The company also control the water powers of Grand and Bishop's Falls, on the main river, where fifty thousand horse power might be developed if required. The facilities for shipping are excellent, as the largest ocean steamers can load at mill wharf in perfect safety in any kind of weather. Shipments are made direct to Great Britain.

Mr. Geo. A. Fowler, manager of the Exploits Lumber Company, may be said to be a lumberman by birth, his father having carried on lumbering operations at Apple River, Cumberland county, Nova Scotia, until the time of his death. For twenty-five years Mr. Fowler, now 47 years of age, has been engaged in the lumbering business. He has spent the past two winters in Newfoundland, and reports that the conditions there are equally as favorable for lumbering as in New Brunswick or Nova Scotia. The average depth of snow is about two feet, and the sledging season lasts about three months.

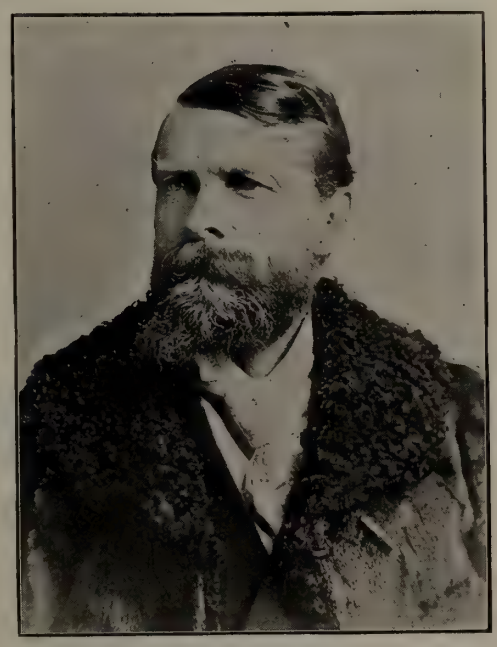
---

In the American Monthly Review of Reviews, which publishes a frontispiece portrait of Rear-Admiral Kautz, the Samoan difficulty is reviewed by the editor in the department of "The Progress of the World."

## ONTARIO FOREST RESERVE.

The Ontario government is making rapid progress towards the adoption of a complete system of reforestation, having recently set apart an important reserve in Frontenac and Addington counties.

Having caused inquiries to be made from time to time as to the most eligible territory for a reservation in the eastern part of the province, the Commissioner of Crown Lands came to the conclusion that the McLaren limits, now operated by Mr. Isaac Allan, of Mississippi Station, were the most suitable for the purpose. These limits cover parts of the Townships of Abinger, Miller, Barrie, Clarendon, Palmerston, Ashby, Denbigh, Effingham, South Caninto, Olden, North



MR. GEORGE A. FOWLER.
Manager Exploits Lumber Company, Botwoodville, Nfld.

Sherbrooke and Oso, and contain an area of 273¾ miles. The territory is watered by numerous lakes and streams and lies on the head waters of the Mississippi river, a stream of considerable importance flowing into the Ottawa river, and on the head waters of a branch of the Madawaska river. All the available good land has been either sold or located, and the merchantable pine timber has been almost entirely cut away, the pine growth remaining consisting of young trees springing up, which are spread over considerable areas of the territory, and if protected from fires and allowed to attain a fair growth will, it is deemed, become a valuable asset of the province in the not distant future.

Negotiations were opened between Mr. Allan and the department, and ultimately the former agreed to surrender the limits on the following conditions :—

That last year's dues, amounting to $759.14, and ground rent, amounting to $828, in all $1,587.14, shall be waived ; that subject to the direction of officers or agents appointed for the purpose by the Commissioner of Crown Lands, he shall be allowed to cut on the territory surrendered for a period of five years ; that he shall not be charged dues on worm-eaten or dead pine cut during this period, and that dues shall not be exacted on hemlock bark where the timber from which the bark is taken is made into logs and sawn into timber ; that he shall be permitted to renew his licenses in the ordinary terms for any small areas which, from their situation, may not be included in the reserve.

In regard to the first condition as to remission of ground rent and dues, it will readily be seen that bearing in mind the magnitude of the territory surrendered and the purposes for which it is required the amount of $1,567.14 is of little consequence. With respect to cutting, under the direction of officers of the Crown Lands Department, the Commissioner of Crown Lands came to the conclusion that having made a considerable outlay in the refitting of his sawmill and expended further sums in the repairing of dams, etc., on the steams, Mr. Allan could not be expected to surrender the territory immediately and remove his plant. As the cutting is to be under the direction of the officers or agents of the department, it can be confined to such trees as might be, from their age or other circumstances, cut and disposed of, and at any rate can be limited to such an extent as not to interfere with the beauty of the landscape or the purposes for which the area has been set aside, and it is only to continue for a period of five years. The concession that Mr. Allan shall not be charged dues on dead and worm-eaten pine is not important. This class of timber has very little merchantable value, and the removal of the tall, bare poles will remove an eyesore from the woods. The amount involved in dues on hemlock bark will not be of great consequence, and where the full duty is exacted on the timber from which the bark is taken the waiving of the dues upon the bark is a concession which might well be made.

---

## UTILIZING STOCK FOR SPECIAL PURPOSES.

Speaking of utilizing different kinds of stock to supply material that is scarce, a writer in the Mississippi Valley Lumberman says : I had an unusual experience the other day. An order for some No. 1 boards, twenty-four inches wide, surfaced one side, was going the rounds without a taker. We took the contract and arranged to have it sawed out of two-inch plank, although the buyer was very particular about having perfect, even width lumber, full thirteen-sixteenths in thickness. The usual way of filling such an order would be to re-saw the plank and then run the stock through the planing mill. This would certainly have produced uneven, wavy lumber. To smooth it down afterwards would have resulted in making it too thin. So we insisted on the plank being first planed on both sides and then run through the re-saw. The result was we had two perfect boards ; the rolls having smooth surface to press, kept the saw exactly in the middle,

## THE DEVELOPMENT OF WOOD-WORKING MACHINERY.*

By John Richards.

As has been explained, forest sawing, or green sawing, as it is sometimes called, is in Europe a less important process in timber-coverting than it is in the United States. Log sawing is carried no further than the reduction of timber to merchantable shape by removing the surplus wood and waste, so that the balks and deals will be in suitable form for transportation and for re-sawing at the timber yards, where they are reduced to finished dimensions as wanted.

This is, in several respects, a rational way of proceeding, which will, no doubt, be introduced into the American continent when timber becomes scarcer and dearer than it is now, and when the market and methods of selling are adjusted to such a system. The advantages are that the timber is not injured in transportation by breakage or exposure, and can be handled at half the cost when proper tackle is employed ; there are no grit, dust, and season cracking to contend with, and the re-sawn timber can be furnished to customers bright and clean, and with accurate dimensions. Deals, which seems to be a name for any kind of squared pieces whose section is a parallelogram, form a unit from which two-thirds of common lists can be cut out with but little waste, as is proved by the small amount of debris found about saw mills in European cities.

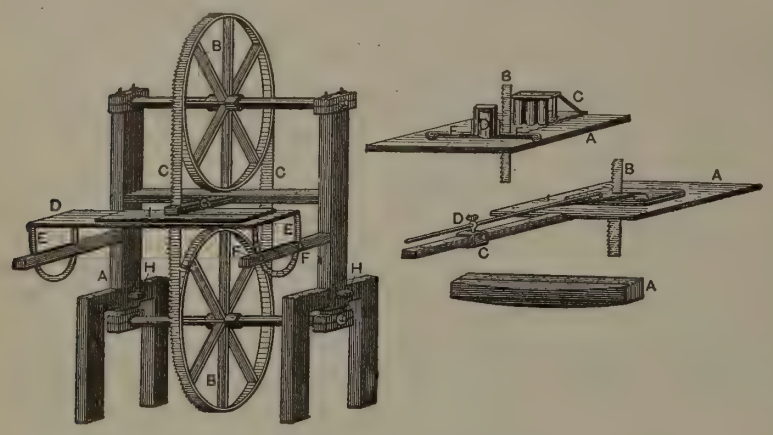


Fig. 1.—The First Band-Saw Machine.
(Patented by William Newberry in 1808.)
Has tipping table for sawing bevels, and feed roll and radius gauge, showing a complete grasp of the capabilities of the invention.

It is commonly assumed that any sharp wood-cutting implement driven by steam power will displace enough shavings or sawdust to supply fuel for the power consumed, but this depends in a great measure upon circumstances. A coarse or thick saw may do this, but a thin one will not, especially when cutting slowly and accurately ; but, setting aside rules, it is obvious that the waste of timber is measurable by the debris of offal in any kind of a wood-working establishment.

It may be remarked here, as a further digression, that furnaces for burning the dry debris from wood-working establishments are usually operated in a wasteful manner by attempting to control the fires, or the amount of steam generated, by the rate at which the fuel is applied to the fires. This is not the best manner, or the most economical one. The furnaces should be kept full of fuel, and the rate of combustion should be regulated by a damper. This dispenses with a great amount of care—not always exercised, however—otherwise required in order to keep a regular supply of steam ; it also avoids bare grates—a common means of balancing the spasmodic effort of shovelling light fuel into a furnace under full draught.

A strong draught is required to open up the fires in case of choking, also in burning wet sawdust ; but the draught should be continually under control, and its full force should be employed only in emergencies. It is an advantage in burning small debris, such as sawdust and fine shavings, to place on the grates a layer of refractory stone, broken into pieces small enough to prevent the unburned fuel from falling through the grates. These stones become red-hot, and serve to ignite fresh fuel, after the manner of a bed of live coals, and are no impediment to clearing the grates.

The characteristics of European log-sawing machines are, in most cases, massive framing ; provision for sawing crooked timber ; thin saws and slower feeding ; a more careful support of saw plates of all kinds ; and a wide use of machines for dressing saws.

The thickness of a saw is to a great extent determined by its size, or length, and this is governed by the dimensions of the logs to be sawn. The writer, on first visiting timber yards in Northern Europe, could not get rid of the impression that the round timber was all culls or waste. A raft load of logs in the Gotha river in Sweden was thought to consist of telegraph poles. It happened to be a collection of small timber even for there, and a visit to the Pacific coast of North America, soon after, still further emphasized the enormous difference in the timber resources of the two countries. Soon after arriving in San Francisco there was encountered in the street a squared beam of fir more than a hundred feet in length, being hauled to a factory in course of erection. Following this beam to its destination—a woolen factory then being built—it was a matter of astonishment to find all the longitudinal beams, or "stringers," of the same length. This astonishment was increased when the contractor said : "We never bother about dimensions, and just order what we want." A section eight feet in diameter, cut from a redwood tree, completed a new impression of American forest timber.

The care of saws, mentioning as a distinguishing feature of European practice, is a refinement. For twenty years past there has been but little use of files for this purpose. About twenty years ago there were invented and put in use various modifications of machines for sharpening saws, both straight and circular, that saved a good deal in the expense of sharpening ; but this was not the chief end attained. The main thing was the truth of the saws, which divided the work equally between the teeth.

It would be difficult to convey in words an idea of the difference in working between a saw that is perfectly round or straight and one that is not. A sawyer knows by the "feel," the moment a saw touches the wood, whether the teeth are true. The sound is different ; so also is the result ; and even the greatest care in hand-filing will not produce an effect like that of machine-grinding, because the teeth are separately dressed, depending on sight, and require frequent jointing, or grinding off of the points, while the saw is in motion.

The steel thus wasted is commonly a good deal more than that consumed by the wear of cutting, so that half the cost of saws is lost ; besides this, hand-filing is commonly done at points of the teeth alone. The gullets, or spaces between the teeth, soon become too shallow to hold the sawdust, and the saws require "gumming" —formerly done by punching out between the teeth, which left the saws with inherent strains and frequently with cracks.

The grinding of saw teeth with emery wheels is no doubt extensively practised everywhere now, but the filing process continues to a great extent where machines would be much better. Such machines, when well made and provided with the required adjustments, cost a good deal, but when the waste of files and of the steel lost in jointing is taken into account, it is seen that the cost of a good machine is soon saved.

So much has been already explained respecting the importance and manner of re-sawing timber in European yards that but little remains to be added, except illustrations of the machines ; and even this requires but little in the way of explanation or remark, because the machines in common use are practically of one type—light gang saws adapted to run at high speed

Such machines are the result of "natural selection," free from complication, quickly adjusted, and when the number of cuts or kerfs are three or more with a single machine, or four to six with a double machine, the speed of performance is such as to meet all the requirements, economic and other, that arise in practice.

The gang of saws can be changed from one dimension to another in a few minutes, and when there are several machines available, as is common in the larger timber yards, a list of "stuff" can be cut out as fast as it is measured or counted and loaded on wagons.

With the equilibrium type of machines having two saw frames that move oppositely, the speed can be from 350 to 400 strokes per minute, which, with only four saws, gives a cutting movement of the teeth equal to a thousand feet per minute. Both circular and band saws are employed in re-sawing, but not to a great extent. The evolution of the latter, which has taken twenty years or more in the United States under what may be called "high pressure effort," has not proceeded so fast as in Europe, where the timber is more obdurate and experiments are more dreaded.

Why reciprocating re-sawing machines, or deal frames, as they are called in England, have not gained a place in American practice is not easy to explain ; the probability is that, if in large cities some timber-yard owner would provide a set of such machines and cut out to order for his customers such sizes as are wanted, the business would be profitable. It would, for one thing, save much expense and waste in planing, as planing would be unnecessary except for surfaces to be painted or varnished.

Prominent among wood-working machines, and the first to relieve workmen of heavy drudgery, are saw benches—machines consisting essentially of a bench with a circular saw projecting through the top and adaptable to a wide range of purposes.

In these machines, as in most other classes, there is wide divergence between American and European practice, and in the uses to which the machines are applied. Practice or design arises out of uses or adaptation, and this accounts for many differences between the machines, as will be explained further on.

Saw benches in the United States are commonly made for light work, such as cross cutting and ripping boards and planks ; but in Europe they are employed for heavier work and are provided with saws four, and sometimes five feet in diameter. American saw benches are nearly all for hand-feeding, and in Europe nearly all have some kind of gearing to feed or advance the timber—an indispensable feature for large and heavy pieces, such as round logs up to 18 inches diameter, which are sawn there on benches.

This term saw bench is a flexible one in its application in Europe, and is applied to machines that in America would be called "saw mills ;" in fact, the term bench is applied to almost any kind of a machine for operating circular saws. Saw benches are made in a heavy substantial manner, the spindles being large and fitted in gun-metal bearings, and the frames being cast in one piece.

Fig. 2.—Log Band Sawing Machine.
One of the most complete log band mills built in England, closely modelled after American designs, and representing good English and American practice.

* From Engineering Magazine, London, Eng. Several illustrati ns included in original article are here omitted.

There are some features in European saw benches that ould with advantage be adopted by American makers, nd will have to be, if saw benches ever become an article f export trade. One of these is the method of arranging he fences, or gauges, that guide the timber. In respect o these, it may be noticed that in all of the European achines these gauges do not extend much beyond the eeth at the front edge of the saw, and it is not easy to nd any reason for making them longer. Evidently the mber should be free laterally after it is sawn, or behind e cutting teeth, because no guidance or direction of its ourse beyond that point is possible or required, and a auge extending back past the saw, if straight, must be et obliquely to the saw, to prevent crowding the teeth at he rear.

In Europe the saw gauges are made with a loose, or djustable face, which can be set parallel to the saw, nd moved forward or back to suit large or small saws, o that the gauge will not extend beyond the teeth at the ront and that a piece, as soon as sawn through, will be ree at both sides of the saw and can be removed without he dangerous operation of pulling it out from between he gauge and the saw.

Another feature is what are called packing boxes at ach side of the saw, in front of the saw collars. It is ecause of this device that circular saws are made much hinner in Europe than in America, and are driven with ess power. Saws 36 inches in diameter are sometimes nade as thin as No. 14 by the wire gauge, and are rarely hicker than No. 12. The packing boxes have two unctions: they support and steady the saws, and keep hem lubricated. If a saw is crowned laterally, or is inched by the timber, it instantly heats, and this melts r thins the oil in the packing just when it is needed.

Considerable space is taken up by illustrations of Euroean saw benches, and a good many readers will be at a oss to know why these machines have such prominence, nd are so heavily constructed. An explanation of this may contain useful suggestion. In America most esablishments using timber in their manufactures purchase he material sawn into boards, planks, and scantlings. In Europe timber is commonly purchased in the log, by he cubic foot, and is sawn as wanted to the particular sizes needed; hence the necessity of these powerful saw benches.

The writer has reason to believe that the European plan is the best, and might be adopted in the United States, with many advantages, and in this belief he brings to his aid an experience as mechanical manager of a large company at Columbus, Ohio, that consumed yearly about 60,000 to 100,000 cubic feet of hard-wood timber of various kinds. Experiments were made in purchasing a portion of this timber, after it had been sawn at the mills, with the result that the cost was nearly doubled and the quality obtained was decidedly inferior. In the end all the stock consumed was cut from logs of oak, beech, hickory, maple, and ash woods, and, strange to say, experince and "natural selection" led to the use of specially designed saw benches, closely corresponding to those in the last five figures of the illustrations, but less complete and efficient.

The logs were received in short lengths, split when too large, and were sawn with the grain, and also with respect to the growth—a method which produced better material; they also could be selected, and apprortioned to suitable purposes. Two men could easily saw into small sizes five cords, equal to 6,000 feet, board measure, in a day, cut accurately to the dimensions wanted. The waste furnished fuel for the works and left a surplus that could be sold for $300 to $500 a year.

It is possible, in almost any part of the United States, to purchase hard-wood timber by the cord, or cubic foot, at a low price compared with that of sawn material. It is evident that the hauling to saw mills, the sawing charges, and the hauling again to a place for shipping, must cost about half as much as the timber. It is also evident that quality must be inferior when the material is sawn into flinches without regard to growth or grain. In the case spoken of, and in others at the same place, where extensive manufactures in wood were carried on, it would have been preferable to purchase the timber in the log, if sawn stuff could have been obtained at the same price per cubic foot.

It is common to hear it said by consumers of hard-wood timber: "We do not want to trouble with a saw mill;" but, as the illustrations of European saw benches will show, a saw "bench" is all that is required, if it be properly made and strong enough for the work.

MR. J. M. McLAURIN, of Montreal, Canadian agent for the great Boston lumber firm of Skillings, Whitney & Barnes, with yards at Arnprior, Gravenhust, Midland, Ottawa, etc., was in Toronto recently, and discussed the present strained relations as to lumber between Canada and the United States. The proposal of the Michigan men, Mr. McLaurin said, to prohibit entirely the importation of Canadian lumber, would meet with the opposition of all the Eastern States. The supply of white pine in the United States was exhausted, excepting in the Northern States, and a prohibitive tariff on Canadian lumber would simply place the dealers and consumers in the Eastern States at the mercy of the American mill-owners. Mr. McLaurin stated that in Montreal it was anticipated that if the international conference met again the question would be settled on the basis of free lumber for free logs.

* * *

UPON a recent visit to Buffalo, in part to learn of the mysterious ways of the Hoo-Hoo or Black Cat Order (the concatenation, however, being unavoidably postponed), I chatted with a representative of the Buffalo Hardwood Lumber Company regarding trade matters. Of Canadian business, he said that they were buying practically nothing across the border, but were receiving quite a number of enquiries for lumber from Ontario, and were selling some in that direction. He regarded this as one of the indications of the improved times. "But," said he, "in the years of depression we sold nearly as much lumber as we are selling now. The trouble was there was no profit in the business; we were tumbling over each other to get orders, and seemed to think we had to sell so much lumber whether there was any money in it or not. Now we are doing about the same amount of trade and making lots of money." This seemed to be the opinion of other Buffalo dealers, who were all agreed as to the scarcity of hardwood stocks.

* * *

IT afforded the writer much pleasure to meet in Toronto a few days ago Mr. M. H. Glover, a director of the firm of C. H. Glover & Co., box manufacturers and timber importers, of London, England. Being Mr. Glover's first visit to Canada, he had something to say of his impressions upon leaving the steamer at Quebec. "I expected to find," he remarked, "great yards filled with deals, but scarcely a deal could be seen. In England we always favor Quebec goods, the name having become established in earlier years, and look upon shipments from Montreal as likely to be of inferior quality, but now that I understand the conditions I am prepared to purchase deals from any of the St. Lawrence ports, there being really no difference in quality." Mr. Glover's firm import annually in the vicinity of 6,000 standards, or nearly 12,000,000 feet, of spruce, pine and whitewood deals, and in the past about one-quarter of this supply has been of Canadian manufacture, the balance being obtained chiefly from Scandinavia. These deals, which are re-sawn for box-making and other purposes, are of the average widths, that is, seven, nine and eleven inches, but Mr. Glover is inclined to the opinion that, just as the log has given place to the deal of to-day, so will the present sizes give place to narrower dimensions, and that perhaps in the near future. He thinks there is now a tendency in that direction, so that freight will be paid on as little refuse as possible. Anticipating some changes in the business, Mr. Glover was on the look-out for modern wood-working machinery for their factory, and to that end left Toronto for Brantford and other western points. It was his purpose to spend a few weeks in the United States before returning.

* * *

Mr. R. Howland, senior member of the firm of R. Howland & Co., chair manufacturers, High Wycombe, England, visited Canada last winter for the purpose of placing orders for chair stock. At a banquet, after his return to England, he took occasion, while responding to a toast, to refer to his visit to Canada in the following words: "I have been accused of going away to foreign parts for supplies of raw, or partly converted material. Well, I have been in Canada recently, and I found that the people there look upon themselves as Englishmen. They are under the rule of the Queen, and I do not see the difference in obtaining supplies from Englishmen in Canada and Englishmen in Wiltshire, or any other part of the home country, but the main thing to remember is that it is impossible for the manufacturers of Wycombe, who now number some 130 or 140, to be supplied as they were in the old days from the immediate neighborhood, where timber is getting scarce. If we could not get it from other sonrces we could not compete with other places, and we should lose the trade, and workmen would lose their employment. I might say that my experience abroad was that in many things the Canadians are a hundred years ahead of us; and if we intend to keep our trade we must be up and doing, and take advantage of everything that lessens the cost of production. So far from Wycombe manufacturers being foolish in buying turned stuff from Canada, where the timber is almost valueless except for the labor spent upon it, I think if there is foolishness at all it is in Canadians selling the stuff so low that English manufacturers can beat their goods in the home market. This importation has kept down the price of English timber, and has enabled us to compete with makers in other towns. When Wycombe travellers go to Liverpool, Manchester, Birmingham, or other large towns, they have to meet the competition of manufacturers on the spot, who have no carriage to pay. We must have some advantage to enable us to meet the cost of carriage, or we should not be able to do any business."

---

For the benefit of their large and constantly increasing Canadian trade, the Magnolia Metal Company, of New York, have recently opened an office in Room 524, Board of Trade Building, Montreal.

Messrs. Hamelin & Ayers, manufacturers of tweeds, blankets, felts, etc., Lachute Mills, Que., have found it necessary to again increase their works. They make a specialty of felts for pulp and paper mills.

THE CANADA LUMBERMAN
WOOD WORKERS' MANUFACTURERS' AND MILLERS' GAZETTE

MONTHLY AND WEEKLY EDITIONS

PUBLISHED BY

The C. H. Mortimer Publishing Company of Toronto, Limited

CONFEDERATION LIFE BUILDING, TORONTO

BRANCH OFFICE:
NEW YORK LIFE INSURANCE BUILDING, MONTREAL

The LUMBERMAN Weekly Edition is published every Wednesday, and the Monthly Edition on the 1st day of every month.

TERMS OF SUBSCRIPTION:

One Copy, Weekly and Monthly, One Year, in advance..... $1.00
One Copy, Weekly and Monthly, Six Months, in advance..... .50
Foreign Subscriptions, $2.00 a Year.

ADVERTISING RATES FURNISHED ON APPLICATION

THE CANADA LUMBERMAN is published in the interests of the lumber trade and allied industries throughout the Dominion, being the only representative in Canada of this foremost branch of the commerce of this country. It aims at giving full and timely information on all subjects touching these interests, discussing these topics editorially and inviting free discussion by others.

Especial pains are taken to secure the latest and most trustworthy market quotations from various points throughout the world, so as to afford to the trade in Canada information on which it can rely in its operations.

Special correspondents in localities of importance present an accurate report not only of prices and the condition of the market, but also of other matters specially interesting to our readers. But correspondence is not only welcome, but is invited from all who have any information to communicate or subjects to discuss relating to the trade or in any way affecting it. Even when we may not be able to agree with the writers we will give them a fair opportunity for free discussion as the best means of eliciting the truth. Any items of interest are particularly requested, for even if not of great importance individually they contribute to a fund of information from which general results are obtained.

Advertisers will receive careful attention and liberal treatment. We need not point out that for many the CANADA LUMBERMAN, with its special class of readers, is not only an exceptionally good medium for securing publicity, but is indispensable for those who would bring themselves before the notice of that class. Special attention is directed to "WANTED" and "FOR SALE" advertisements, which will be inserted in a conspicuous position at the uniform price of 15 cents per line for each insertion. Announcements of this character will be subject to a discount of 25 per cent. if ordered for four successive issues or longer.

Subscribers will find the small amount they pay for the CANADA LUMBERMAN quite insignificant as compared with its value to them. There is not an individual in the trade, or specially interested in it, who should not be on our list, thus obtaining the present benefit and aiding and encouraging us to render it even more complete.

## PROSPERITY IN THE LUMBER TRADE.

IT is frequently difficult to fully understand the influences which cause the tide of commerce to ebb and flow. Changed conditions come about as if they were the result of a commercial undercurrent. Happily, the Dominion of Canada seems now to be entering upon an era of prosperity; money is circulating freely; industrial establishments are operating to their full capacity; labor is in demand everywhere.

The lumber trade, even amid adverse circumstances, has undergone a wonderful change within the past twelve months. In the face of the closing of the United States market, to a portion at least of the Canadian product, by the imposition of the duty, prices have continued to advance, until to-day manufacturers are, for the first time in several years, selling their lumber at a fair margin of profit. Dry stocks are practically cleaned up at the mills, and much of the cut of 1899 has been contracted for in advance.

It is a singular circumstance that this spring buyers from the Eastern States have paid fully three dollars per thousand more for mill culls on the Georgian Bay than during the days of free lumber. Our manufacturers have realized more for their stock, and the dealer or the consumer, probably the latter, has paid the duty.

There is, we believe, a bright future for the lumber trade of Canada. Heretofore we have depended largely upon the United States market, and consequently when there was an over-production of lumber and prices declined in that market, the result was disastrous to Canadian manufacturers. With a trade wider in its scope, and reaching to all quarters of the globe, this difficulty is not likely to be seriously felt. Business will be more certain, and devoid of the hazard which has always been experienced in catering to the United States trade.

## FREIGHT RATES ADVANCED.

As forecasted in our last issue, the Canadian Pacific and Grand Trunk railways have advanced freight rates on lumber. Although at time of writing the new schedule, which is to take effect on June 1st, has not been issued, it is given out authoritatively that the advance will be on the basis of one-half cent. per one hundred pounds from the Ottawa valley, Georgian Bay, Muskoka, Nipissing, St. Clair river and Lake Erie districts.

We can but reiterate our opinion that the policy of the railways is short-sighted. Every action of this character must result in further crippling an industry which has not been sufficiently developed in the past, and which has been productive of the most meagre profits. One-half cent per one hundred pounds is not a large increase, yet on a carload of lumber of 10,000 feet, weighing 30,000 pounds, it means an additional charge of one dollar and fifty cents, which to the small hardwood manufacturer, upon whom the burden will most heavily rest, it is of considerable moment. Many of the pine mills can ship by water, and are thus somewhat independent during the summer months at least, but the hardwood manufacturers must remain in the grip of the railway monopolists.

There is no disguising the fact that the two great railways in Canada have, to all intents and purposes, been given a free hand in the operation of their systems. They are steadily gaining power, and no one knows to what extent their greed will grow if not checked by governmental authority. Even in connection with the building of the Ontario and Rainy River railway, a line which was expected to provide relief for the people of western Canada, recent developments would seem to show that the C.P.R. are interested in the project, and that they may eventually control the road.

The bill, introduced in the Dominion parliament by Mr. Rutherford, to appoint a Board of Railway Commissioners to act in the public interest, is one which past experience proves to be necessary. Until such a measure is passed, the public may expect to remain in the grasp of the railway companies.

## THE TREND OF THE LUMBER BUSINESS.

THE CANADA LUMBERMAN has always maintained that the wholesale dealer, or middleman, was a useful and necessary agent in the lumber business. He performs duties and accepts responsibilities which the manufacturer is glad to be relieved of, and for which he is willing to allow a reasonable remuneration. Making the study of the market his special business, the wholesaler is constantly on the watch for new outlets for his goods, to the advantage of the manufacturer as well as himself.

While we believe that the middleman will always be a factor in the trade, we are equally convinced of the fact that the tendency of the times is towards more direct relations between the producer and the consumer, particularly with respect to trans-Atlantic trade. The present system of marketing Canadian lumber is as follows: The manufacturer sells his product to a shipper on this side of the water. He, in turn, sells to an importing firm in Great Britain, who again sells to the woodworking factories or saw mills, as they are called, some of which consume from ten to fifteen million feet annually. In passing from the manufacturer to the consumer, the commissions of two brokers is charged against the lumber. These commissions must be paid either by the consumer or by the manufacturer. The consumer refuses to pay a higher price than that for which he can obtain equally good lumber from other countries—in other words, the price is regulated by competition. Consequently, it devolves upon the manufacturer to accept a price for his lumber which will permit of the brokers' profits being paid and the stock sold at a price which will compete with the product of other countries. The producer alone suffers, and hence the desire for more direct trade between manufacturer and consumer.

In the British market Canadian lumber meets strong competition from the Norwegian product, which, we understand, is usually handled from producer to consumer by one broker only. He is recognized as a necessity in the trade. The manufacturer has his money invested in the logs and saw mills; when the lumber is cut the broker assumes the financial responsibility until it is delivered to the consumer, perhaps six months hence; the consumer has his capital invested in wood-working plant and facilities for manufacturing the lumber into the finished product. These three agents are potent factors in successfully conducting an export trade in lumber, but when the business passes through a greater number of channels, the profits of the manufacturer must suffer accordingly. It is not contended that the manufacturer must, of necessity, ship his goods through a broker. If he is in a position financially to take the responsibility, there is no reason why he should not ship direct to the consumer, appointing his own representatives in foreign countries to take the place of the broker.

It is vastly in the interest of Canadian manufacturers to become more closely associated with the consumers of their lumber, and to study the requirements of foreign markets. Within the past few years many changes have taken place in the export trade, and it is only reasonable to expect that changes will continue to take place in the future. Lumbermen should visit foreign countries as frequently as possible, and not be content with the meagre information which is furnished by agents and middlemen. It is encouraging to observe the strong disposition evinced by British importers of wood goods to become acquainted with the timber resources of Canada. Many of them have visited this country for that purpose alone, and as a result orders have been placed with our manufacturers. There is a remarkably large consumption in Great Britain of box shooks, a trade which is yet only in its infancy so far as Canada is concerned. In many other lines the outlook is quite as promising, as is evidenced by the numerous enquiries received at this office and by the High Commissioner for

Canada in London. With cheaper freight rates, which are now almost certain, the trade in forest products with European countries is certain to expand.

## EDITORIAL NOTES.

THE budget speech of Hon. Wm. Fielding, Minister of Finance, gives little encouragement to the lumbermen of Canada that an import duty will be placed on United States lumber. He announces the decision of the government not to disturb the tariff at the present time. These remarks, if taken literally, would settle the question for the time being, but it is possible that action will be taken in one or two instances where it is absolutely necessary, without affecting the tariff as a whole. In any case, the lumbermen should not give up the fight; they have a just cause, and eventually the government will surely accede to their wishes.

The double-acting band mill, although at first regarded by many as an impractical innovation, is undoubtedly one of the most important inventions yet introduced into the sawmilling business. By sawing when moving both forward and backward, the capacity of the mill is increased fully fifty per cent. over the ordinary mill, and with only a slight increase in the number of workmen. Successfully tested for the first time in the United States only last year, it is encouraging to learn that two of these mills have already been placed in Canadian sawmills, the first in the mill of Mr. J. D. Shier at Bracebridge, and the other in that of the Rat Portage Lumber Company. The telescopic band mill has come to stay, and its merits should be fully investigated by lumbermen when building new mills or increasing their equipment.

Deadman's Island, a part of Stanley park, adjoining the city of Vancouver, B. C., has lately been the scene of exciting incidents. The Dominion government granted a lease of the island to one Ludgate, representing a Chicago syndicate, for the purpose of erecting thereon a huge saw mill. This action, it is said, was approved of by a large majority of the citizens of Vancouver, who were eager to reap the benefits to be derived from such an establishment. By a few influential persons the granting of such a lease was opposed, resulting in the ownership of the island, and hence the right of the Dominion government to control the island, being called into question. There was much doubt as to whether the title was vested in the Imperial, the Dominion, or the provincial governments. On May 17th Mr. Ludgate, with a company of sixty men, commenced cutting timber, but was immediately placed under arrest by the provincial authorities. Some of his men remained on the island and continued to cut timber, whereupon the magistrate read the riot act, adding that unless thay dispersed they were liable to be shot down. This warning was effective. Mr. Ludgate has been given his liberty and the matter will likely be fought out in the courts.

THE National Hardwood Lumber Association of the United States, at its meeting in Chicago on the 4th ultimo, appointed a committee to devise a plan for organizing an inspection bureau, with a view to securing, as far as possible, the universal adoption of the rules of inspection in all markets. The plan to be recommended to the association at its forthcoming annual meeting is that the association shall issue a certificate of inspection on hardwood lumber, much as a board of trade issues a certificate of inspection on grain, this certificate to form a basis for sales and contracts, or, in other words, to be a guarantee of the quality of the lumber. A committee of nine shall have charge of the inspection bureau, they to appoint a chief inspector to supervise the work of subordinate inspectors, these latter to be recommended by the organization of hardwood lumbermen in the locality in which they are to operate, or in case there is no association in the locality, then by leading firms who are members of the National Association. The subordinate inspectors are to receive as remuneration a fee from the buyer and seller for the inspection done, said fee to be fixed by the parties interested, and ten per cent. of same to be paid by the inspector to the secretary of the association. Where the inspection is not satisfactory, an appeal may be made to the chief inspector, but in no case can the certificate be altered. The plan as outlined above is no doubt one of some merit, being the product of the brains of practical lumbermen, yet we doubt if it would be found successful in practice. For instance, as we understand the phraseology of the report, a certificate issued by the subordinate inspector must be final, even though he may have favored the buyer or the seller. It would be little satisfaction for the aggrieved party to know that the inspector had been dismissed, while the injury done was allowed to stand. Nevertheless, the movement is along the proper lines, and the efforts of the National Hardwood Lumber Association to secure uniform inspection rules should be encouraged. We would be glad to learn of a similar movement in Canada.

## TRADE OPENINGS.

The Ontario Forestry Department has received enquiries from Great Britain regarding the quality of birch timber to be found in Canada. There is said to be a good demand in Great Britain for Canadian birch for furniture manufacture.

At the office of the High Commissioner, London, Eng., the following enquiries have been received: For the names of exporters of birch spool wood from Quebec and the maritime provinces; from a firm of importers of turnery and joinery, for the address of Canadian exporters of basswood broom handles and ash rake and fork handles; from a Spanish house, for names of Canadian timber merchants; for names of exporters of birch cut in squares for making bobbins—in any lengths up to one foot square—other wood, such as oak or beech, might be quoted for instead of birch, so long as there is no bark in it; from a Swedish firm, for Canadians open to export aspen wood for the manufacture of match splints. Large quantities are already imported from Russia.

EXCELSIOR OR WOOD WOOL.—Previous reports have shown, writes Mr. Harrison Watson, that the main and almost insuperable obstacle lies in the necessarily heavy cost of transport, which would have the effect of limiting any trade which Canadians might possibly secure to the more expensive grades, for which, unfortunately, there is a much less demand than for the medium and coarse. Some transactions have resulted between a large importer in the Midlands and a Halifax, N. S., producer. Latterly the position has become rather more unfavourable. Several firms has commenced making excelsior in the United Kingdom, with the result that values have still further declined, and the continental supplies, even with low freights, have been shut out. It is stated that the results of manufacturing the material in Great Britain have not been profitable.

WOODEN SKEWERS.—Regarding wooden skewers, it is learned that the business in Great Britain is practically in the hands of an American corporation, which supplies the trade through resident London houses. Generally speaking, the principal demand is for the ordinary hickory round skewer, and about half the trade is in the 7 inch size. The "Gypsy" skewer used in Canada has not been adopted in Great Britain to any extent, although one or two lots have been sent over. Mr. Harrison Watson, curator of the Canadian section of the Imperial Institute, writes that some small lots of maple skewers from Canada have been well received, but the American hickory skewers practically hold the market. If Canadian makers can compete with the United States in price, there should be no lack of trade. Besides an immense trade in meat skewers, there is a very large number used by cotton manufacturers for holding bales while being hydraulically pressed, and by woollen manufacturers to fasten bags of wool.

PULP.—Mr. H. M. Murray, government agent at Glasgow, Scotland, gives the following as the views of an importer of Canadian pulp: "Canadian sulphite pulp is much in favor with our paper-makers as to quality of fibre, but they claim that sufficient care is not taken in screening to remove chips of bark, shines and other impurities. We believe that there is a great future for Canadian sulphite if manufacturers comply with the wants of the market." Mr. Amstead, manager of the Ely Paper Mills, the largest manufacturer of paper for newspapers in the United Kingdom, states that many mills in Scandinavia have a good reputation for turning out pulp of reliable quality, and this is a factor which will require reckoning in the Canadian calculations. The British paper-makers are somewhat prejudiced against some of the pulps supplied from America, because of the bad packing. They do not ship the stuff in good condition, and although some mills may think little of it, the bulk of the makers pass it by on this account.

In the last report of the High Commissioner of Canada to the Department of Trade and Commerce at Ottawa, particulars are given regarding wood-flour, for which there is a demand in Great Britain. It appears that wood-flour is used to some extent as an absorbant for nitro-glycerine in the manufacture of various explosives, and a finer grade is also required for the manufacture of a certain kind of linoleum. The manager of a large house engaged in the explosive business estimates the consumption of wood-flour in this trade at about 700 tons per annum. The wood-flour must be made from white wood, free from resin and impurities, special care being taken that no nails or other scraps of metal are present in it. The moisture must not exceed 5 per cent. The wood-flour must be ground to such a degree that it will pass through a sieve of fifty meshes to the lineal inch, but not more than one-third through one of one hundred meshes. The price paid is from £4 3s 10d to £4 10s per ton of 2240 lbs. at factory. Stout canvas bags containing about 200 weight each are used for packing. The High Commissioner has forwarded samples to the Department at Ottawa.

BOX WOOD.—The High Commissioner has also been making enquiries regarding the prospect of importing box wood from Canada. In reply to an enquiry, Messrs. Bryce, Junor & White, of 32 Bassinghall street, London, E.C., write: "There is, we understand, a very considerable trade done in box pieces in this country, but we have always found that the Canadians cannot deliver cheaply enough to compete with Scandinavian goods. Stock should be white Canadian hardwood, ⅜ inch thick, ¾ inch ends, ready cut to make up cases measuring inside 24 × 18 × 13, the wood to be similar to that used by the Quaker Oat Co." Messrs. Baker & James, 164 Corporation street, write that their single trade is box boards, which they are always open to buy, and subject, of course, to the price and quality, they could place sufficient trade to keep a number of saws going. With regard to the demand for tin-plate shooks, i.e., boxes in which tin-plates are packed, a firm writes that the chief tin-plate districts are Llanelly, Morrison, Neath, Port Talbot and Britain Ferry. It is probable that the pieces suitable for making boxes for packing tin-plates, measuring 14 × 10, 14 × 8¾, 14 × 20, 14 × 19¼ and 10 × 20, might be imported cut already for nailing together, but for a very large proportion of the trade boxes could not be made economically out of such pieces. Another correspondent writes that he is informed that the boxes are all made at the tin-plate works, the best of elm, and the second quality of birch. He believes that a trade might be done if the bottom, top and sides were cut in sizes and sent over in packages.

## DOMINION TIMBER LANDS.

The annual report of the Department of Interior of the Dominion of Canada states that the timber dues collected during the year 1898 amounted to $119,769.03, being an increase of $50,274.85 as compared with the previous year. Of this amount, $21,081.26 was for bonuses, ground rents, royalties and dues on timber cut from lands in the railway belt in the province of British Columbia. The total revenue received from timber in Manitoba, the North-West Territories, and the Yukon territory, up to July 1st, 1898, was $1,569,893.17, and the total revenue from timber within the railway belt of British Columbia up to same date, $326,086.19. During the year 39,096,407 feet B.M. of lumber were manufactured from timber cut under licence in Manitoba, the North-West Territories, and in the railway belt in British Columbia.

The Crown Timber Agent at Winnipeg gives the following information in regard to the quantity of lumber disposed of in Manitoba and as far west as Regina :

| | 1897. Feet. | 1898. Feet. |
|---|---|---|
| Red and white pine from the Lake of the Woods manufactured principally from logs brought from the State of Minnesota | 45,000,000 | 53,000,000 |
| Red and white pine from points lying east of Rat Portage, all cut from Canadian logs | 10,500,000 | 13,000,000 |
| United States pine (manufactured) imported from the State of Minnesota | 16,871,104 | 35,751,960 |
| Canadian spruce manufactured from timber cut in Manitoba | 14,241,909 | 15,267,041 |
| British Columbia products | 6,000,000 | 9,000,000 |
| Total | 92,613,013 | 126,019,001 |

Following is a comparative statement of the average price of lumber within the several Crown timber agencies during the past fourteen years :

| Agency. | 1885. Per M. | 1894. Per M. | 1895. Per M | 1898. Per M. |
|---|---|---|---|---|
| Winnipeg | $13.50 to $25 | $17 | $ 7 to $19 | $12 to $ 5.50 |
| Brandon | 20 to 2 | 15 | 15 | 13 to 15.00 |
| Whitemouth | 11 to 12 | ..... | 10 | 10 to 11.00 |
| Calgary | 25 to 30 | 8 to 16 | 8 to 16 | 8 to 6.00 |
| Fort McLeod | 30 | 10 | 10 to 16 | 7 to 16.00 |
| Lethbridge | ..... ..... | 9 to 16 | ..... | ..... |
| Prince Albert | 30 to 45 | 10 to 25 | 8 to 25 | 15 to 17.50 |
| Edmonton | 25 to 30 | 18 | 13 to 16 | 10 to 12.00 |
| British Columbia | ..... | 10 | 7 to 9 | 7 to 8.00 |

The number of timber berths granted in the province of Manitoba and the territories is 306, and within the railway belt in British Columbia 166. Fifty-one berths have been granted in the Yukon territory, covering a total area of 20½ sq. miles.

The report states that it has been decided not to issue permits to cut timber on Dominion lands along the eastern slope of the Rocky Mountains and the fonthill country adjacent thereto south of Bow river, and to preserve the timber as far as possible from being destroyed, with the view of securing a permanent supply of water for irrigation purposes.

Mr. E. F. Stephenson, Crown Timber Agent at Winnipeg, in a report to the Department, gives the following statement of importations of lumber from the United States since that commodity was placed on the free list :

| | Dressed. | Undressed. |
|---|---|---|
| October 31st, 1893 | 180,306 | 1,174,747 |
| " " 1894 | 647,388 | 3,073,195 |
| " " 1895 | 1,108,268 | 5,668,250 |
| " " 1896 | 2,103,857 | 9,853,883 |
| " " 1897 | 1,913,832 | 14,857,272 |
| " " 1898 | 4,219,438 | 31,532,522 |

## MARINE INSURANCE RATES.

BELFAST, May 15th, 1899.

Editor CANADA LUMBERMAN, Toronto :

DEAR SIR,—Referring to your article in this month's issue entitled "Discrimination in Marine Insurance Rates," we would say that our Underwriters assure us the extra charge from Montreal (which is very slight) is no more than is warranted by their experience of losses due to the difficulties of navigation incident to a long river voyage, and our experience bears out this contention.

With regard to the statement that "The extra rate charged in summer from St. John, N. B., as compared with Bangor, Maine, is said to be equal to a discrimination of ten shillings per standard on deals," this if a fact would be sufficiently alarming, but it is evidently a clerical error. The total cost of insurance of spruce deals by steamer from St John to British ports during the summer would not amount to more than seven cents per Petersburg standard, and we do not think the rate is any lower from Bangor, Maine.

Respectfully yours,
MUNSTER, SIMMS & Co.,
Timber and Insurance Brokers.

## WOODMEN'S LIEN ACT.

At the recent session of the Nova Scotia legislature Mr. E. McDonald, M.P., of Pictou, introduced in and carried through the House of Assembly a bill designed to protect workmen employed by lumbermen. The bill was defeated in the Legislative Council, but it is Mr. McDonald's intention to again bring it forward at the next session. For the information of lumbermen the chief clauses of the bill are given below, regarding which the CANADA LUMBERMAN invites an expression of opinion :

Any person performing any labor or services in connection with any logs or timber intended to be driven down rivers or streams, or hauled directly from the woods or brought by railway to the place of destination, shall have a lien thereon for the amount due for such labor, service or services, and the same shall be deemed a first lien or charge on such logs or timber, and shall have precedence over all other claims or liens thereon, except any lien or claim which the Crown may have upon such logs or timber for or in respect of any dues or charges, or which any owner of lands may have for the stumpage upon such logs or timber, or which any Streams Improvement Company or Boom Company, or person owning streams, improvements or booms, may have thereon for or in respect of tolls.

The lien provided for in section three shall not attach or remain a charge on the logs or timber unless and until a statement thereof in writing, duly verified upon oath by the person claiming such lien, or some one duly authorized on his behalf, shall be filed in the office of the clerk of the County Court in the county in which the labor or services, or some part thereof, have been performed.

The statement of claim shall, in respect of work done in the woods, be filed within forty days after the last day on which such labor or services were performed, and in respect to work done in stream driving or otherwise than in the woods, within twenty days after the last day on which such labor or services were performed ; provided that no sale or transfer of the logs or timber upon which a lien is claimed under this Act during the time limited for the filing of such statement of claim and previous to the filing thereof, or after the filing thereof and during the time limited for the enforcement thereof, shall in anywise affect such lien, but such lien shall remain and be in force against such logs or timber in whosesoever possession the same shall be found.

In case of the transfer by sale or chattel mortgage of any logs or timber which may become subject to a lien under this Act, the purchaser, before paying his purchase money or giving a mortgage or other security for any balance of such purchase money, or the mortgagee before advancing any money on the security of a chattel mortgage or otherwise, may require from the vendor in the case of a sale, or from the mortgagor in case of a mortgage, an affidavit or statutory declaration by such vendor or mortgagor (as the case may be) or his agent, stating that all claims for wages have been paid.

Any person or person having a lien upon or against any logs or timber, may enforce the same by means of the proceedings hereinafter stated.

Without issuing a writ of summons, the claimant may apply to a judge of the County Court of the county in which the logs or timber may be, and upon the production to the judge of an affidavit verifying his claim and showing that the same has been filed as aforesaid, also stating the particulars of the claim and showing that the claimant has fully performed his contract, and that the amount is justly due and owing to him, and that payment thereof has been demanded and refused, the judge may thereupon, if he thinks it in the interest of justice to do so, make an order under his hand, directing that a writ of attachment may issue to the sheriff of such county, commanding such sheriff to attach, take and safely keep such logs or timber, whereupon a writ of attachment may issue out of the County Court, which shall be in the form 2 in the schedule to this Act, or to the like effect.

Upon the delivery of the said writ of attachment to the sherriff, he shall act thereon according to the exigency of the said writ.

At the conclusion of the enquiry, the judge shall make his report and order, which shall state his finding, and direct the payment into a bank to be specified by him of the amounts (if any) so found to be due, and the costs, within ten days thereafter ; and in default of such payment, that the logs or timber shall be sold by the sheriff for the satisfaction of the amount found due to the several parties upon the enquiry.

In default of payment into a bank under the preceding section within the time named in the order therefor, the said logs or timber shall within twenty days thereafter be sold by the sheriff holding the same, in the same manner and subject to the same provisions of law as goods seized or taken under execution, unless the judge shall direct that additional publicity be given to the sale, and the amount realized by such sale, shall, after deducting the expenses thereof payable to the sheriff, be paid into a bank to the credit of the cause, and shall upon the application of the several parties found to be entitled thereto under the order of the judge, be paid out to them by the clerk of the said court by check drawn upon the said bank to the orders of the parties entitled thereto respectively.

## PAPER ON FORESTRY.

The Commissioner of Crown Lands for Ontario offers a prize of $10.00 for a paper on "The Forestry Problem as Applied to Ontario," to be written by a graduate of the School of Practical Science. No restriction is made as to choice of subject. It may relate to the engineering phase of forestry, to forest fires and prevention, timber cutting, forest reproduction, or any other allied subject.

Papers are not to exceed 2,000 words, and the successful manuscript is to become the property of the Bureau of Forestry for publication in the annual report. Manuscripts are to be sent in to the Bureau of Forestry on or before December 1st, 1899. The decision as to the merit of the manuscripts will rest with William Houston, M.A., McMaster College; Alexander Kirkwood, Crown Lands Department ; and Thomas Southwotrh, Clerk of Forestry.

## PERSONAL.

Mr. James Shearer, a director of the James Shearer Company, Montreal, was presented with a handsome silver service by the employees of that company on the occasion of his recent marriage.

Mr. Knowlton Mixer, of the wholesale lumber firm of Mixer & Company, Buffalo, was a recent caller at the office of the CANADA LUMBERMAN. Mr. Mixer was arranging for a tour through the Georgian Bay district, in search of pine lumber, shingles and lath.

Mr. J. R. Eaton, of Orillia, Ont., returned last month from a trip to Great Britain. Combining business with pleasure, he made arrangements to manufacture doors for the British market, and hopes soon to be turning out large quantities of these goods. His factory will be kept in operation the year round.

The CANADA LUMBERMAN observes that the membership list of the National Wholesale Lumber Dealers' Association includes the following Canadian representatives : Gillies Bros. Co., Braeside, Ont.; Hull Lumber Co., Hull, Que.; E. H. Lemay, Montreal ; E. C. Grant, Ottawa Lumber Co., Ottawa ; Keenan Bros., Owen Sound, Ont.

At a recent meeting of the town council of Woodstock, N.B., a complimentary address was presented to Mr. Wm. Fisher, who has been treasurer of the town for nearly twenty years, but who has been obliged to resign owing to business engagements. Mr. Fisher is now the head of the firm of the Small & Fisher Co., foundrymen and manufacturers of shingle machines, etc.

## TRADE NOTES.

John S. Mason & Co., wholesale dealers in hardwood lumber, 240 Eleventh avenue, New York City, are sending their friends a useful souvenir. It is a double pocket map of Greater New York, showing all the streets and points in the metropolitan lumber district.

The Dodge Manufacturing Co., of Toronto, are earning a well deserved reputation as power transmission machinery manufacturers. The Dodge wood split pulley has revolutionized the world on the pulley question, and the Dodge system of rope transmission of power has worked wonders in the way of economical distribution of powers from various points to a common centre. The Dodge patent split friction clutch pulley and cut-off couplings is said to be giving every satisfaction, and the "Orton" disc-clutch for small pulleys, while a comparatively new production of the Dodge Company, is claimed to be equally satisfactory wherever used. The company inform us that manufacturers and mill owners can now send in their specifications of shafting, hangers, pulleys and belting, and have them filled at once from stock. They have recently put in a modern shafting lathe, as well as a lot of other special machinery for their new lines, which are fully described and illustrated in a very complete catalogue to be had for the asking. The Dodge Manufacturing Company are manufacturers of everything in the transmission line, with works at Toronto Junction and offices at 74 York street, Toronto.

The Waterous Company, Brantford, advise us that they have recently shipped the following orders : To J. D. Shier, Bracebridge, the first telescopic band mill that has been erected in Canada, and the second one to the Rat Portage Lumber Co., Rat Portage ; a No. 3 Allis band to W. D. Lummis, Spragge, Ont., who is placing it in the Cook mill to cut some American stocks ; some eight car loads of machinery, consisting of two 200 h.p. engines, coupled, and six large boilers and other machinery, to the Columbia River Lumber Co., Beaver, B.C.; a large circular mill, with 150 h.p. engine and boilers, to Price Bros., Batiscan, P.Q., and a similar outfit, but with a band mill, to J. H. Dansereau, Vercheres, P.Q. The novelty of the latter mill is that it is built and designed entirely on a scow, which is to be towed from Vercheres to Montreal and operated at Montreal. In portable mills they have sent three to the Northwest this winter, one for the Elk Park Ranch Co., Elk Park, B.C., and another to Mr. Tetley, for Dawson city. A third has just been shipped to Louis Coste, engineer for the Dome (Yukon) Mining Co., also for Dawson City. These are the Waterous portable mills, specially adapted for easy transportation to mining districts. In marine work the Waterous Company have just completed an engine and boiler for a tug for Chew Bros., Midland, another for Captain Chapman, Lion's Head, and a third for the tug "Ann Long" to the Wiarton Tug Co., consisting of a boiler and steeple compound engine, and another Fitzgibbon boiler and fore and aft engine for Nickerson Bros., Midland.

## WEEKLY EDITION

The Lumberman Monthly Edition, 20 pages } $1.00 PER YEAR { The Lumberman Weekly Edition, every Wednesday

*THIS PAPER REACHES REGULARLY THE PRINCIPAL LUMBER MANUFACTURERS AND DEALERS THROUGHOUT CANADA, AND WHOLESALE BUYERS IN GREAT BRITAIN THE UNITED STATES AND OTHER FOREIGN MARKETS.*

VOL. V. TORONTO, ONT., MAY 31, 1899 No. 19.

## CANADA LUMBERMAN

PUBLISHED BY

**The C. H. Mortimer Publishing Co'y of Toronto, Limited**

*Confederation Life Building - TORONTO.*

Branch Office:
NEW YORK LIFE INSURANCE BUILDING,
MONTREAL.

**Weekly Lumberman,** published every Wednesday. Contains reliable and up-to-date market conditions and endencies in the principal manufacturing districts and leading domestic and foreign wholesale markets. A weekly medium of information and communication between Canadian timber and lumber manufacturers and exporters and the purchasers of timber products at home and abroad.

**Lumberman,** Monthly. A 20-page journal, discussing fully and impartially subjects pertinent to the lumber and wood-working industries. Contains interviews with prominent members of the trade, and character sketches and portraits of leading lumbermen. Its special articles on technical and mechanical subjects are especially valuable to saw mill and planing mill men and manufacturers of lumber products.

☞ Subscription price for the two editions for one year, $1.00.

LUMBERMAN'S

VEST-POCKET

INSPECTION BOOK

Containing Rules for the Inspection and Measuring of Pine and Hardwood Lumber in the leading markets of Canada and the United States. Embracing also many useful tables and calculations of everyday service to lumbermen.

*Prepared by the Editor of the "Canada Lumberman."*

Toronto, Canada
C H. MORTIMER, Publisher
1895

THE above is a fac simile of the title page of the latest and most complete Lumber and Inspection Book published.

We shall be pleased to send you a copy on receipt of four 3 cent Canadian postage stamps

THE CANADA LUMBERMAN,
*Toronto, Canada*

## WANTED AND FOR SALE

Advertisements will be inserted in this department at the rate of 15 cents per line each insertion. When four or more consecutive insertions are ordered a discount of 25 per cent. will be allowed. This notice shows the width of the line and is set in Nonpareil type; 12 lines make one inch. Advertisements must be received not later than 4 o'clock p.m. on Tuesday to insure insertion in the current week's issue.

WANTED.—SITUATION AS LUMBER INspector, Shipper, Culler or Bookkeeper. T. H. Buckerfield, Burk's Falls, Ont.

FOR SALE.

COMPLETE SAW MILL MACHINERY, PLANing, Sash and Door Machinery; modern and in good condition. Can be seen at Toronto. Apply PETER RYAN, Toronto.

**Washington Timber Land For Sale.**

I HAVE A NUMBER OF TRACTS OF TIMBER Land in the State of Washington for sale; from 1,000 to 40,000 acres in each tract; heavily timbered with Cedar, Fir and Spruce. CHARLES RICHARDSON, Tacoma, Washington.

WANTED.

FLOOR MANAGER FOR SASH AND DOOR Factory; also for Box Factory. Must be first class, practical men. Apply, stating age, experience and salary required. Send references. GILMOUR & Co., Trenton, Canada.

**BOX BOARDS FOR SALE**

CUT TO ANY DESIRED THICKNESS, AND lengths not exceeding 24" long, in Brown Ash, Basswood or Spruce.

J. E. MURPHY, Hepworth Station, Ont.

WANTED.

PRICE ON MAPLE, BEECH, BIRCH, ASH and Elm, 5/8, 1 and 2 inches. Also Basswood 5/8 and 1 inch, and pine 1 inch, all log run. Also on Spruce 1 inch, suitable for manufacturing boxes. Quote also on pine squares 9 x 2 x 2, 29 x 2¼ x 2¼, 9 x 2¾ x 2¾, 29 x 3¼ x 3¼. Quotations on cars at mill. Address, B. SOUTO & Co., 161 Front Street, New York.

### VENEERS WANTED.

A large furniture manufacturer in Belgium writes to the CANADA LUMBERMAN that he is in the market for veneers in 2, 3 and 5 ply, of various thicknesses, for panel and table work, and that he would like to make connection with some Canadian manufacturers of these articles. Interested persons may obtain the address of our correspondent at this office.

### LUMBER HANDLERS' SCALE AT BUFFALO.

On account of the differences existing between the grain shovellers and freight handlers at Buffalo, the lumber contractors took advantage of the situation and made a claim for an advance in the price for unloading forest products, also for stowing on the docks. After consultation, the stevedore committee of the Buffalo Lumber Exchange acceded to their demands. The following prices have therefore been agreed upon for unloading, effective May 22: Log run white pine, including strips and mill culls, 26 cents a thousand; shorts, 44 cents; 14 inch strips in lots in hold, 36 cents; Norway, 1 to 2 inches, not over 18 feet, 26 cents; Norway bill stuff, 3, 4 and 5 inches, 32 cents; hemlock same as for Norway. This is an advance of 4 cents per thousand all round. Lath, 7 ¼ cents a thousand, an advance of ¼ cent; shingles, 18 inch, 4⅛ cents; 16 inch, 3⅛ cents, an advance of ⅛ cent; cedar posts, 1 cent each; basswood, 30 cents a thousand; elm, 40 cents; ash, maple and oak, 45 cents. This is an advance of 5 cents on basswood, 15 cents on elm, and 10 cents on ash, maple and oak. The prices for stowing on dock remain the same.

### CURRENT TRADE CONDITIONS.

ONTARIO.

If the lumber situation has undergone any change within the past week, it has been in the direction of further improvement. Mills are busy shipping out stock, and orders now placed cannot be filled for weeks to come. Each day brings its business, and the volume of trade continues to swell. As building operations for the season have only fairly commenced, the lumber requirement for this purpose, for one month at least, is likely to expand rather than decline. There may be a falling off in trade during the summer months, but no one believes that the demand will slacken to any extent, as consuming industries have light supplies on hand and must continue to add to their stock. All grades of pine find a ready market, while pine lath is scarce and advancing in price; the wholesale price in Toronto is $1.60 for No. 1 and $1.25 for No. 2. Pine shingles, 16-inch XXX, sell at $2.40 wholesale, and XX at $1.50. Dealers still report a great scarcity of hardwoods. Prices have been well maintained generally, although maple is not being purchased to any extent, and consequently there is a possibility of weakening values. Manufacturers are asking $12 for mill run maple, a price which dealers believe to be out of proportion to the other woods, in view of the available supply. Soft elm, mill run, is selling in Toronto at $16 to $18 for inch and inch and one-half, and $17 to $19 for two to three inch. There has been an advance of about five dollars per thousand in quartered oak, which nows sells at $50 to $60 in Toronto.

QUEBEC AND NEW BRUNSWICK.

The lumber trade in Montreal is somewhat unsettled owing to the recent failures. The business conducted by John A. Bulmer & Co. was quite extensive, the liabilities being over $200,000. No sooner had this assignment become generally known than the embarrassment was announced of A. P McLaurin & Co. In both of these failures a number of lumbermen, in city and elsewhere, are interested. These occurrences are but another indication that lumber is being sold on a margin of profit altogether too small. So far as export trade is concerned, business is in good shape, and quite a large number of vessels have been chartered for June and July loading. The tendency of prices is to advance.

MANITOBA AND BRITISH COLUMBIA.

The strike in the building trade at Winnipeg has been settled, and lumber is likely to move actively in the near future. Trade at present is rather quiet both on city and country account, but the season promises well and dealers are pleased with the prospects. Tee production of lumber this year by the Lake of the Woods mills will be greater than ever before. In British Columbia the mills are unable to supply the demand for lumber, and as a result building operations have been kept back. Every day new building projects loom up, and it is feared that some of the cities will be overdone in this respect. Foreign trade is in a prosperous condition, but vessels are scarce.

UNITED STATES.

The transactions of the past week show conclusively that the lumber market of the United States is steadily improving. Prices at the mills have been maintained, and wholesale prices, which have been the weak spot in the trade, are getting into line. There has been a heavy movement of stock to the eastern markets, where trade has picked up wonderfully within the past month. The improvement is not confined to pine and hardwoods, but extends to all classes of lumber, and particularly to hemlock, which has undergone another advance of 75 cents per thousand. At New York the scarcity of dry lumber is becoming more marked day by day, and with a large amount of building arranged for, a season of great activity is assured. A scarcity of lath and shingles is still reported at Buffalo, although these are being received freely by vessel. The famine in hardwoods is still the feature of that trade. In many markets green lumber is being sold to consumers at practically the prices formerly prevailing for dry stock. As the season advances the opinion is gaining ground that there will be no weakening in hardwood prices this summer, especially as much of the production of this year is already contracted for. Several furniture manufacturers in the east are said to have ceased turning out certain lines of their output, simply because they cannot obtain the lumber necessary for their production.

FOREIGN.

The impression, prevalent in the British market earlier in the season, that the supplies forthcoming would prove the heaviest for some years, has been considerably modified, and instead merchants now entertain the possibility that the production at the various mills abroad may turn out to be quite limited. This fact is having an effect upon prices of both Baltic and Canadian stock. In Baltic whitewood a firming tendency is reported, and there seems a probability that prices may go 5s. higher before long. Spruce deals are also strengthening, and some contracts have recently been made at considerably advanced prices. At Liverpool

some stocks from Shediac have sold at £6 8s 9d c.i.f., and others in proportion. A point on which merchants are not unanimous is the course which spruce prices are likely to take later in the season. There are a few who believe that values will not go beyond their present basis, but those most closely in touch with the trade believe that the highest point has not yet been reached. The demand is so good at present that all the first imports will go direct into consumption. There is no material change in the pine market, while hardwoods are inclined to strengthen.

The German market is in good condition, but buyers in France are exhibiting much caution. A number of vessels have been chartered to load at maritime province ports for Cuba and other West India Islands, where trade is steadily reviving.

### STOCKS AND PRICES.

Sprague's saw mill at Winnipeg resumed operations last week, the first drive of logs having arrived.

The barque Cedar Croft cleared from St. John, N. B., last week for Rosario, with 955,914 feet of dry lumber, shipped by A. Cushing & Co.

The Assiniboine Lumber Company, of Brandon, Manitoba, are reported to have sold their mill, lumber in stock, and logs cut last winter, to John Hanbury, of that place.

The Department of Interior at Ottawa invites tenders up to June 26th for a license to cut timber in British Columbia on berths containing an area of 60 square miles.

It is reported that J. & T. Conlon, of Little Current, Ont., have disposed of all the lumber now in their yard, and that their mill will resume operations at an early date.

The logs cut on the St. Croix river, in New Brunswick, last winter, will contain about 13,000,000 feet. The owners are James Murchie & Sons. H. F. Eaton & Sons, Granville Chase and F. H. Todd & Son.

Raft towing from the Georgian Bay district to Michigan has commenced. It is now estimated that not over 75,000,000 feet of Canadian logs, cut prior to April 30, 1898, and on exempted lands, will be taken across the lake this season.

At Toledo, Ohio, a noticeable feature is the increased demand for good lumber. Shop and better, and 8/4 and 6/4 shop, are scarce, and 4/4 shop, dry, is about out of the market. No. 3 and No. 4 boards have advanced considerably, owing to short supply and large demand.

The Newfoundland Iron Ore Co., Limited, of Workington, Newfoundland, invite tenders for the delivery at Old Perlican, Trinity Bay, Nfld., of a large quantity of 10 and 12 inch square spruce timber. Particulars may be obtained from the superintendent, Mr. S. Herbert Williams.

The Newville Lumber Co. have chartered the schooners Avin, Susan, Annie, Hatty McKay and Sarah F. to load lumber at Parrsboro, N. S., for the United States. When these vessels are loaded it will make nine cargoes shipped by the above firm to the United States, besides a cargo to Port of Spain, Trinidad.

Maple lumber, log run, is being sold at about $16 on the Chicago market. There is a probability of somewhat lower prices for birch this season than existed earlier in the year. Supplies have been considerably augmented during the past season, and dry stocks have not run down to the low point observed in other kinds of hardwood.

Lath is in much demand at Buffalo, while as yet there is but a meagre supply. Pine lath sells at about $2.25. Shingles are being received more rapidly than lumber, which is an indication that trade is strong. Clear buts sell at $2.10 and upwards. Mixer & Co. recently received two cargoes, containing about 4,000,000 shingles.

In New York it is probable that another advance will be made in the price of northern pine. Mills are reported so full of orders that they cannot ship for a month. Spruce has gone up 50 cents and is still scarce. In Boston random cargo spruce ranges from $13 to $14.50, according to stock. Hemlock has reached the highest figure in its history in New York, being now on a basis of $13.25.

At the Canadian Government office, London, Eng., enquiry has been made for the names of lumber firms prepared to supply large quantities of wood blocks, suitable for paving purposes, and railway sleepers. A firm in Warsaw, Russia, desire to act as agents for the sale of Canadian produce. They point out that Warsaw is an important market for veneers, rolling boards, etc.

The Saginaw river wholesale market is firm. There is very little lumber offering except for stock to be cut for future delivery. Thus far this spring the Saginaw Lumber & Salt Company has sold 10,000,000 feet to be cut. C. K. Eddy & Sons have sold several million feet, which is now being manufactured. The Central Lumber Company has also sold ahead, and C. S. Bliss is behind with his orders.

At a recent auction sale held by, Foy, Morgan & Co., London, Eng., the following prices were realized : 16 ft. 3 x 11 in. first quality pine, £20 15s ; 6-7 ft. 3 x 11 in. spruce, £6 5s ; 6-8 ft 3 x 9 in. spruce, £5 17s 6d ; 13 ft. 3 x 9 second quality spruce, £7 15s ; 10-13 ft. 3 x 8 in. first quality spruce, £7 10s ; pine, ex Ashanti, from Quebec, sold as follows : 13-18 ft. 6 x 11 first quality, £15 ; 12-18 ft. 6 x 9, £14 ; 12-18 ft. 5 x 11, £15 ; 4 x 11 £15 5s; 12-18 ft. 5 x 9, £15.

The secretary of the Mississippi Valley Lumbermen's Association has made a canvass of stocks of dry white pine lumber in the territory covered by that association, and finds a total shortage of lumber, as compared with the stocks of one year ago, of 398,000,000 feet. This shortage is largely attributable to the large amount of business done in low grade lumber during the past winter and spring. The shortage shown on January 1 was 140,000,000 feet, which indicates the immense volume of business done since that date. A large portion of the season's cut of the mills at the head of the lakes is sold ahead. The demand for low grade lumber is phenominal.

A report from Fredericton, N. B., dated May 26th, says : Reports from up river state that unless there are some heavy rains soon to raise the water, a large number of logs will be hung up and cannot possibly be got out until next spring. W. J. Noble has between five and six million feet at Seven Islands, which can only be got out with a big rise of water. John Kilburn has about 10,000,000 feet hung up on Northwest rapids. Donald Fraser & Sons' drive of 8,000,000 feet on Green river is coming along slowly and will probably be brought out safely. Cunliff, with seven million, reached corporation limits last night. R. A. Noble, with 7,000,000, will probably reach corporation limits in a day or two.

Offerings of pine on the Chicago cargo market continue to be light, although considerable lumber is being sold. Short piece stuff sells at $11.50 to $11.75 for dry, and short green piece stuff on the basis of $11. Yard dealers are compiling a new list on the basis of $13 for short lengths of piece stuff f.o.b. Chicago, with the exception of 2×4, 10 ft., which is listed at $13.50. The advance in list prices during the past two weeks amounts to 50 cents per thousand on the lower grades and from $1 to $2 per thousand on the grades and thicknesses of shop lumber that are in most active demand. There has been no change in No. 1 and No. 2 12-inch stock boards. In shingles the yard dealers are asking from 5 to 10 cents more than ruling prices of two weeks ago, and prices on lath have been advanced to $2.50 for white pine, $2.40 for mixed, $2.30 for No. 1 Norway, and $2.15 for No. 1 hemlock. It is said that there never has been a time when lath were so scarce.

### LUMBER PRICES.

Lumber prices at the present time, says the American Lumberman, are about as high as they were in 1892, and in some cases higher. There should be a gradual advance in average prices as the years go by, for in spite of natural growth the quantity of available timber is decreasing and a carrying charge is to be added. But it is probable that the carrying charge since 1892 or the spring of 1893 and the present time has been covered by the advance.

It should be remembered that 1892 and the first few months of 1893 marked the culmination of a profitable business period that was followed quickly by the panic and a heavy decline in values, which are only now being restored. At the present time the country is not at the culmination of a "boom" period, if such it may be called, but apparently hardly begun on a period of industrial and commercial prosperity of indefinite length.

The change began in 1897 and with some fluctuations there has been on the whole a steadily swelling volume of business ever since. Lumber prices have moved upward since the summer of that year and the tendency is still upward. What will be the outcome? Prices are now at a point which yield a profit if properly distributed to all engaged in the business—manufacturers, all legitimate middlemen and distributors. This is as it should be, and is for what the Lumberman has always stood.

Incidentally, however, we might throw out a warning. There is a growing feeling through the country that prices of many commodities are being pushed too high. It is doubtful if this is the case with lumber ; but it certainly would be better to rest content with what already has been secured than to risk collapse by carrying the process of price increment to the point of inflation. Still, the warning may be unnecessary ; in fact, there is a feeling quite generally noticeable through the lumber trade that the top notch of average prices has nearly or quite been reached, though a few items or classes of stock may yet go higher.

### SHIPPING MATTERS.

From Montreal vessel rates on lumber rule about as follows : To Liverpool, 35s to 37s 6d ; Glasgow, 42s 6d ; London, 40s ; Bristol, 45s ; Leith, 50s ; Aberdeen, 50s ; Belfast or Dublin, 42s 6d to 45s ; Manchester, 42s 6d.

Following are current freight rates on lumber from British Columbia points : To Sydney, 37s 6d to 40s ; Melbourne or Adelaide, 47s 6d to 50s ; Port Pirie, 45s to 47s 6d ; Freemantle, 57s 6d to 60s ; Shanghai, 50s to 52s 6d ; Tientsin, 60s ; Valparaiso, f.o., 41s 3d to 42s 6d ; South Africa, 62s 6d to 65s ; U.K. or Continent, 65s.

As already announced, the Grand Trunk and Canadian Pacific Railways have issed new lumber tariffs, advancing by ½ cent per 100 lbs. the rate on pine and hardwood lumber to various points in Ontario. At time of going to press, the tariff of the C. P. R. had not been received. Elsewhere will be found reference to the G. T. R. rates.

The following additional charters are reported : Str. Wuotan, 1,200 tons, Pugwash, N.S., to w.c. England, deals, 45s ; str. Pawnee, 1,167 tons, St. John, N.B., to Liverpool, deals, 45s ; bark Altona, 491 tons, Bridgewater, N.S., to Buenos Ayres, $10.50 ; Beleverie, 573 tons, Montreal to Rosario, $11.50 ; bark Rosa, St. John, N.B., to Cork or Limerick, deals, 47s 6d, August or September loading ; bark Adelaide, Miramichi, N.B., to Oran, France, deals, 64 francs.

The Timber Trades Journal reports the following charters : St. Thomas, Que., to Garston, 800 stds., 46s 3d, June ; Three Rivers or Pierreville, Que., to London, 900 stds., 42s 6d, June ; Pierreville to London, 1,200 stds., 42s 6d ; Quebec or Three Rivers to e.c. London, deals at 43s 9d, timber at 65s; Quebec to London, 1,150 stds., 43s ; Bathurst, N.B., to Bowling, 1,000 stds., 45s, June ; St. John, N.B., to w.c. England, 1,000 stds., 43s 9d ; West Bay, N.S., to w.c. England, 1,000 stds., 42s 6d ; Miramichi, N.B., to w.c. England or e.c. Ireland, 1,100 stds., 45s ; Bathurst, N.B., to Bombay, deals, 45s, June ; several small sailers from Pugwash, West Bay, and other N.S. ports at 45s to 45s 6d, according to ports of discharge.

### BUSINESS NOTES.

A. P. McLaurin & Co., lumber merchants, Montreal, are announeed to have assigned, with secured and unsecured liabilities amounting to $64,871.65. The heaviest creditors are McLaurin Bros., partly secured, $41,558.

A statement of the affairs of J. A. Bulmer & Co., lumber merchants, Montreal, shows total liabilities of $229,254.69. Of this amount $167,454.69 is secured and the balance unsecured. Mr. Justice Mathieu has appointed Hon. A. W. Atwater provisional guardian, with authority to carry on the business until the appointment of a curator.

## LUMBER FREIGHT RATES.

### CANADA ATLANTIC RAILWAY.

Lumber freight rates on the Canada Atlantic Railway, according to the summer schedule effective April 1st, are as follows: Ottawa, Rockland, Hawkesbury and intermediate points to Toronto, 10 cents per 100 lbs.; Parry Sound to Toronto, pine 10 cents, hardwood, 11 cents; Ottawa to Oswego, $1.90 per M ft.; Ottawa to Syracuse, $2.20 per M ft, (3,000 lbs. and under per M ft.); Ottawa to Montreal, $1.00 per M feet, lath 20 cents per M pieces; Quebec, $2.00 per M feet, lath 40 cents per M pieces; Arnprior to Montreal, $1.50 per M feet, lath 30 cents per M pieces; Quebec, 2 cts.; Pembroke to Montreal, $1.75 per M ft., lath 35 cents per M pieces; Quebec, $2 75 per M ft., lath 55 cents per M pieces; Ottawa to New York, $2.50 per M ft., lath 50 cents per M pieces; Arnprior to New York, $3.00 per M ft, lath 60 cents per M pieces; Pembroke to New York, $3.25 per M ft., lath 65 cents per M pieces; Parry Sound, track, $3.50 per M ft., lath 70 cents per M pieces; Ottawa to Buffalo, 12 cents per 100 lbs.; Ottawa to Port Huron and Detroit, 14 cents per 100 lbs.; Ottawa, Rockland and Hawkesbury to Boston and common points, local 15c.; exports 11c. per 100 lbs.; Arnprior to Boston and common points, local 17 cents, export 15 cts. per 100 lbs.; Parry Sound to Boston and Portland and common points, local 21½ cents, export 20 cts. per 100 lbs.; Ottawa, Rockland and Hawkesbury to Portland, &c., 15 cts.; Arnprior to Portland, 17 cts.; Ottawa to Burlington, 6c. per 100 lbs.; Ottawa to Albany, 10 cts. per 100 lbs.; Arnprior to Albany, 12 cts. per 100 lbs.; Parry Sound to Albany 17 cts. per 100 lbs.; Ottawa to Scranton and Wilkesbarre, Pa., also Binghampton, N.Y., 13 cents per 100 lbs, from Arnprior 15 cents, from Parry Sound 20 cents per 100 lbs.; Ottawa to St. John, N.B. and common points, 20 cents per 100 lbs.; Ottawa to Halifax, N.S., and common points, 21 cents per 100 lbs. Minimum carload weight for shipment of lumber, lath, shingles, etc., is 30,000 lbs., and rates quoted above are in cents per 100 lbs., except when quoted per M ft.; minimum carloads 10 M ft., lumber not exceeding 3,000 lbs. per M ft.; lath 50,000 rates pieces, not exceeding 600 lbs. per M pcs. Ottawa apply on shipments from Rockland and Hawkesbury.

### GRAND TRUNK RAILWAY.

The freight tariff on lumber issued by the Grand Trunk Railway Company, effe tive June 1st, 1899, contains the following general instructions: Minimum weight 30,000 lbs. per car, unless the marked capacity of the car be less, in which case the marked capacity (but not less than 24,000 lbs.) will be the minimum weight. Exceptions—Cedar posts in box cars, dry basswood and light pine or cedar lumber, dry cedar shingles, charcoal and sawdust, which cannot be loaded up to 30,000 lbs. or up to the marked capacity of car, will be carried at actual weight, minimum 24,000 lbs. The rates on lumber in the tariff will not be higher from an intermediate point on the straight run than from the first named point beyond to the same destination.

Excepting to Toronto and Hamilton, the rates on hardwood are the same as on pine. To these two points the rate on hardwood is one-half cent higher than on pine.

From Glencairn, Creemore, Aurora, Barrie, Collingwood, Penetang, Coldwater, Waubaushene, Sturgeon Bay, Victoria Harbor, Midland, Fenelon Falls, Longford, Gravenhurst and other points in groups B and C, to Toronto or Hamilton, 7c. on pine and 7½c. on hardwood; Bracebridge to Toronto or Hamilton 7½c. pine and 8c. hardwood; Utterson, Huntsville, Navor, Emsdale, Katrine to Toronto or Hamilton, 8c. pine, 8½c. hardwood; Burk's Falls, Berriedale Sundridge and South River, to Toronto or Hamilton, 8½c. pine, 9c. hardwood; Trout Creek, Powassen and Callender to Toronto or Hamilton, 9½c. pine, 9c. hardwood; Nipissing Junction and North Bay, 10½c. pine, 11c. hardwood Rate from Goderich, Kincardine, Owen Sound and Wiarton to Toronto or Hamilton, 7c. pine, 7½c. hardwood. These rates are per 100 lbs. Rates from Toronto east to Belleville are 8c. per 100 lbs. The maximum rate from any point north or west to Montreal is 16½c. per 100 lbs. For rates on railway ties, tie timber, cedar lumber or posts, mahogany, rosewood, walnut, cherry, and other valuable woods, application must be made to the district freight agent.

## OBITUARY.

Mr. J. P. Mowatt, lumber merchant, Campbellton, N. B., died in the Royal Victoria Hospital, Montreal, a fortnight ago. He was about fifty years of age.

General regret was expressed in Toronto when the news was received of the sudden death of Mr. A. W. Belding, forest ranger for the Ontario government in the Biscotasing district. The cause of death was the bursting of a blood vessel. Deceased was forty-three years of age, and had been in the employ of the Ontario government for the past four years, prior to which time he was engaged in the lumber business.

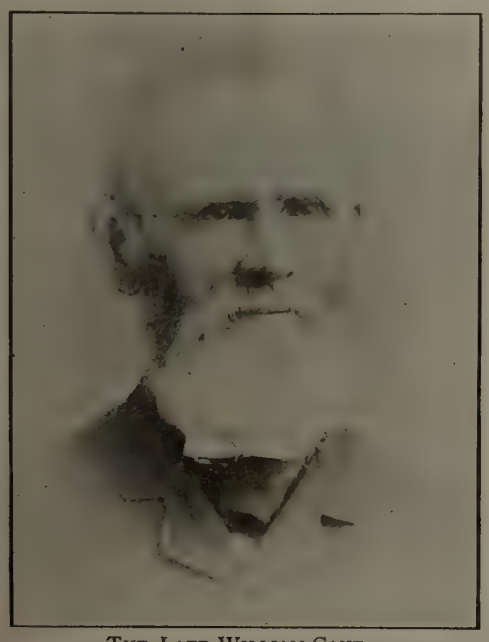
A highly respected resident of Ottawa passed away last month, in the person of Robert Rowley Booth, brother of J. R. Booth, the well-known Ottawa lumberman. Deceased was born at Waterloo, Que., sixty-six years ago, being the fourth son of the late John R. Booth, of that place. He removed to Ottawa about 1860, and was engaged in the lumber business for a number of years, but retired from active business some time ago.

## WILLIAM CANE.

After an illness extending over a period of fifteen months, the death took place on May 17th of Mr. Wm. Cane, founder of the extensive wood-working factory at Newmarket, Ont., now operated by the Wm. Cane & Sons Mfg. Company, Limited. Mr. Cane was a descendant of the Canes of Antrim, Ireland. His father, Mr. Samuel Cane, emigrated to America and settled in Albany, N. Y., where Mr. Cane was born on Octobor 8, 1822. When a child his father moved to Upper Canada and settled in the Township of Caven, about fifteen miles from Port Hope, both parents dying three or four years afterwards. He received an ordinary education, finished by private study.

The subject of this sketch lived for a time in Mariposa and Lindsay, and in 1840 located at Queensville, in the Township of East Gwillimbury, seven miles from Newmarket, where he had a shop making pumps, wagons and other wood-work. He also purchased a saw mill about a mile and a half north of Queensville. In 1864 he built a saw mill, boarding house and several other buildings on the fifth concession of East Gwillimbury, about three and a half miles southeast of the village of Queensville. Here he soon had a very extensive business, running a saw and planing mill, lumber yard and a large farm, besides engaging in several smaller lines. Here he met with his first great misfortune. The mill took fire, and was burned to the ground. He rebuilt the mill and soon had it running once more, but he was not left long in peace. The place was again visited by a disastrons fire, which consumed the saw mill and thousands of feet of lumber. This was a terrible loss, but here he showed the pluck and energy which kept him up through life. Again the men were set to work and the mill rebuilt. He ran this until 1874, when he decided to move to Newmarket.

In February, 1875, he erected the present family residence, a steam saw mill, a planing factory and several houses for his workmen. He also purchased the Sykes



THE LATE WILLIAM CANE.

foundry and engine works. In May, 1875, the foundry and engine works were burned. Shortly after he built the large tannery which he afterwards sold to Park & Co. In 1885 Mr. Cane suffered another terrible loss by fire. The large pail and woodenware factory, along with two large dry kilns, a store house, office, several lumber sheds and a large quantity of valuable lumber were consumed.

Mr. Cane and his sons decided to form a joint stock company. The present Wm. Cane & Sons Manufacturing Co., Limited, was formed, with Mr. Cane as president. A temporary factory was built and used during the season of 1884. The company then built the present large brick structure, which is really three factories, separated by solid brick fire walls. They also put in a splendid system of waterworks, built a fire hall, purchased a hose reel and full equipment for fighting fire. In 1887 the factory again caught fire, when the second storey of the pail factory was burned. To-day the company are among the largest manufacturers of woodenware in Canada, doing a large home trade and also shipping to foreign countries.

The late Mr. Cane held various public offices in East Gwillimbury, and when Newmarket was incorporated as a town, he was elected mayor by acclamation, serving in that capacity for nine years, and then resigning. He was prominently associated with the town's advancement, and aided greatly in pushing forward a number of local enterprises to completion. He was president of the North York Reform Association, but refused to accept further honors.

In private life the deeds of Mr. Cane were such as to command the highest esteem. He was a friend to the poor, of Christian character, and of noble impulses. In 1844 he was married to Miss Belfry, and his wife, six sons and two daughters survive him. Four of his sons are now connected with the business, Mr. H. S. Cane, the general manager, being mayor of Newmarket.

## JOHN A. CAMERON.

A widely known and most highly respected citizen of Ottawa passed away at his residence, Stadacona Hall, on May 14th, in the person of Mr. John A. Cameron.

THE LATE JOHN A. CAMERON.

For nearly 60 years he had been associated with the commercial and industrial development of the Ottawa valley, while at the same time giving liberally of his time and talent to public service.

The late Mr. Cameron was born in the county of Glengarry in the year 1820, was educated at the Baptist College at that time existing in Montreal, and as a young man began his business career with the late Stephen Tucker, then an extensive lumberman at Papineauville, P. Q. After being in his service for a few years, he entered the employ of the well known and extensive lumber concern of Gilmour & Co., in whose employ he remained for several years. In the early fifties, he, with his late brother, Mr. G. W. Cameron, established saw mills and a general lumber business on the Blanche river at Thurso, P.Q., which business a few years later passed into the hands of Gilmour & Co., the management, however, remaining in the hands of the subject of this sketch.

In 1862 Mr. Cameron formed a co-partnership with Mr. J. C. Edwards and purchased the Blanche limits and the mills at Thurso from Gilmour & Co., the firm name being Cameron & Edwards. Later this firm, together with the late James McLaren, of Buckingham, purchased the limits and mills belonging to Gilmour & Co. on the North Nation river, and for several years the business was carried on under the name of J. A. Cameron & Co. In 1871 Cameron & Edwards sold their Blanche limits and properties to W. C. Edwards & Co., of Rockland, the business of which firm was established there in 1868 by W. C. Edwards and James Wood, and each Mr. Cameron and Mr. J. C. Edwards, at the time of the sale of the Blanche properties, became partners in the firm of W. C. Edwards & Co. In 1882 W. C. Edwards & Co. purchased the limits, mills and other properties of J. A. Cameron & Co. on the North Nation river, and thus those properties finally became amalgamated in one business, and with the amalgamation Mr. Cameron retired from the active management of the business, and since that time has devoted himself to the management of his large farm and to giving attention to the various charitable and philanthropic interests to which he was so much devoted. In his earlier and middle life, however, he had much experience in the conduct of the various branches of the lumber industry, and perhaps more particularly the woods part of it, in which branch he was regarded as an authority.

During the many years that he resided in Thurso, Mr. Cameron was the leading man of his district, always taking a prominent part politically as well as in municipal and agricultural matters, and in fact, in every way in which he believed the general good of the community could be promoted. He was for many years the mayor of his town, was for some years captain of the Thurso infantry company of volunteers, and in 1878 was an unsuccessful candidate in the Liberal interest for the Dominion House against the late Alonzo Wright.

In 1884 Mr. Cameron moved with his family to Ottawa, where at Stadacona Hall, his beautiful residence, he lived until the time of his death. Mrs. Cameron having died some three years ago, and the greater share of his large family of ten children being scattered over the various parts of Canada, only two sons and one daughter remain to occupy the homestead.

In so far as a donor to various charities is concerned, Mr. Cameron pursued a course very different to most men. Instead of waiting till the time of his death to be a benefactor in this direction, he acted on the principle of being his own executor, and during his life he gave of his means as few men do in aid of religious and charitable objects. Few know to the full extent of his doing in this direction, and those few have always felt that, considering his very large family, his charities towards others went frequently too far. The Baptist denomination, to which he was strongly attached, profitted the most largely from his benevolence, but he was a never ending contributor to public charities generally, as well as to individuals. He was one of the pioneers of the Ottawa valley, and will be much and generally missed and his loss regretted in the many spheres of usefulness in which he lived.

## BRITISH COLUMBIA LETTER.

(Correspondence of the CANADA LUMBERMAN)

The lumbermen of the province are in better spirits than they have been for several years, due to the fact that their mills are crowded with orders and that prices have stiffened considerably. But considering the prices that are paid the jobbers for logs, the margin of profit in the business is yet too limited. Manufacturers south of the border continue to ship in low grade stock at ridiculously low prices, and until some protection is afforded Canadian lumbermen by the Dominion government, the conditions will not be materially improved. The increased demand for lumber has resulted in the starting up of several mills which have been idle for some time. The McLaren-Ross mill, on the Fraser river, about two miles from New Westminster, is about to be put in operation. For this purpose Mr. J. M. Portias arrived from Ottawa a fortnight ago. This mill is one of the best equipped on the coast, has a capacity of 125,000 feet per day, and is complete in every respect. Arrangements will probably be made to do an export trade, although the owners are offering for sale both the mill and timber limits. The limits comprise over 55,000 acres of virgin Oregon pine, cedar and spruce. The Port Moody plant, owned by the Canadian Pacific Lumber Co., which has not been operated for years, is to start up again under the management of Mr. P. D. Roe. Mr. Geo. Cassidy formerly operated this mill.

The city of Vancouver recently invited tenders for the annual supply of lumber. When the tenders, four in number, were opened, it was discovered that in each instance the prices quoted were the same, the tenderers having evidently come to an agreement in this respect. Robertson & Hackett were awarded the contract, but I have not learned at what figures.

The price list issued by the British Columbia Shingle Manufacturers' Association gives the following quotations on red cedar shingles delivered to dealers at Ontario railway points and Montreal: No. 1 shingles, 6 butts to 2 inches, $2.55; No. 2 shingles, 6 butts to 2 inches (5 in. clear), $2.25; No. 1 shingles, 6 butts to $2\frac{5}{8}$ inches, $2.70; No. 1 shingles, 5 butts to 2 inches, $2.95. For plain dimension shingles add 50 cents and for fancy butts add $1 per thousand.

The announcement has been made of a through rate of $136.50 per thousand feet for all classes of lumber, with the exception of fancy milled work, for Dawson, by the White pass route. This rate applies on all lots over 10,000 feet, and taking the first cost at British Columbia points at $16 per thousand, building material could be delivered at the Klondike capital in ten days' time for a total cost of $152.50. If lumber at Dawson is worth $250 per thousand, as reported, there should be a gold mine in the business of shipping lumber from this province.

### COAST CHIPS.

Christie & May have opened an office in Vancouver as lumber agents.

Houston & Co., manufacturers of sashes and doors, Golden, have been succeeded by W. L. Houston.

The Boundary Creek Milling and Lumber Company have purchased another plant, which will be erected in the vicinity of Rock Creek.

E. H. Heaps & Co., of Hastings, have recently put in a new shingle and saw mill plant. Thos. Kilpatrick, who has a shingle mill at Hastings, has put in saw mill for the manufacture of cedar.

Mr. Barnard Lequime has removed his saw mill plant from Kelowna to Midway. The plant, when complete, will include planers, stickers, band saws, mortising machines, turning lathes, etc.

NEW WESTMINSTER, May 15, 1899.

# THE NEWS.

—A. E. Howse is erecting a saw mill at Princeton, Ont.

—John Letherby has opened up in the lumber business at Midland, Ont.

—D. G. Loomis & Sons are erecting a box factory at Sherbrooke, Que.

—Blenkhorn & Sons, of Canning, N.S., are rebuilding their axe factory.

—The Granby Box Co. are enlarging their box factory and dry kilns at Granby, Que.

—The Midland Box Shook & Planing Co. have just erected a new mill at Midland, Ont.

—Coon Bros. are erecting a veneer factory at Morton, Ont., and will employ a large number of hands.

—John Morris is erecting a new planing mill at Goderich, Ont., to be fifty feet square, two storeys high, with engine room 16 × 20 feet.

—The Conger Lumber Co. are making considerable improvements to their mill at Parry Sound. The circular saw will be replaced by a band mill.

—W. C. Williams, of Midhurst, Ont., has put a new 30 h.p. boiler in his planing mill. It was manufactured by Dyment, Butterfield & Co., of Barrie.

—The Board of Examiners of Cullers for the province of Quebec will meet at Hull on June 12th, to examine candidates desirous of obtaining licenses as cullers.

—J. Clarkson, for many years foreman for the Rat Portage Lumber Co. at Norman, has gone to British Columbia, where he has secured a lucrative position.

—G. B. Housser & Co., lumber manufacturers, Portage la Prairie, Man., have opened branch yards at Bagot, on the C.P.R., and at Willow Range, on the Northern Pacific.

—It is reported that H. R. McLellan, the well-known lumberman of St. John, N.B., recently put on an additional $100,000 of life insurance, making the total amount carried $275,000.

—The steamer Bavaria recently loaded at St. John, N. B., the largest cargo of lumber ever moved from that port. It consisted of 1,700 standards of spruce deals, 500 tons of birch timber, and 100 tons of pine.

—The new mill of Wood, McKinley, Argue & Co., at Parry Sound, Ont., commenced operations recently, under the management of E. C. McKinley. It will cut about 12,000 feet per day, and will be enlarged next summer.

—J. J. Hill, of the Great Northern railway, recently acquired a logging railroad running north from the main line of the Great Northern to Hibbing, in the Rat Portage district. It is said that he intends to extend it northward to Koochiching.

—V. L. Emerson, of Ottawa, has received from the authorities of McGill University, Montreal, a report of the result of a test of his method of manufacturing calcium carbide from sawdust. It is said that the report is favorable to the project.

—The Rathbun Co., of Deseronto, Ont., are erecting a saw mill at Tweed, where they will cut railroad ties and small logs. This company recently invited tenders for freighting about 60,000 cedar railway ties from Manitoulin Island ports to Buffalo.

—Frank Laurie has been engaged for some time in overhauling the Parry Sound Lumber Co.'s shingle mill at Parry Sound, Ont. An addition to the mill has been built and a new Trevor shingle splitting machine put in. The output of the mill will be 150,000 shingles per day.

—W. H. Murray, W. M. Mackay, John E. Moore and others, of St. John, and Chas. T. and S. H. White, of Sussex, N.B., are seeking incorporation as the St. John Iron Works, Limited, to take over the business conducted by Waring, White & Co. The capital is to be $60,000.

—Incorporation has been asked for the General Chemical Carbide Co., of Ottawa, the petition being signed by Wm. C. Edwards, H. K. Egan and V. L. Emerson. The purpose of the company is to convert waste wood, shavings, sawdust and wood products into calcium carbide and other by-products.

—The annual meeting of the Lake St. John Railway Company was held in Quebec last month. The statement presented showed that there were carried during the year 1898, 4,043 cars of lumber, 347 cars of timber, 1,426 cars of pulpwood, 807 cars of ties, 258 cars of logs, and 2461 cars of pulp and paper.

—Allan Ritchie, of Newcastle, Ernest Hutchison, of Douglastown, Edward Eastman, of Petitcodiac, New Brunswick lumber merchants, together with a number of other capitalists, are applying for incorporation as the New Brunswick Oil & Gas Co., Limited, with a capital of $1,000,000 and head office in Moncton.

—E. H. Bronson and Levi Crannell, of the Bronson & Weston Lumber Co., Ottawa, are among the incorporators of the Union Match Company, of Trenton, N.J., which has an authorized capital of $10,000,000. The purpose is to manufacture and sell matches in the United States and Canada in competition with the Diamond Match Company and other concerns.

—A dispatch from Ottawa, dated May 11th, stated that C. Langelier, superintendent of forest rangers for the province of Quebec, was in Hull for the purpose of appointing special cullers and shippers at the various saw mills at the Chaudiere which cut logs taken from Quebec limits. It is understood that the returns heretofore handed into the government are believed in some cases to have been incorrect.

—Work is proceeding rapidly on the Restigouche and Western railway, which will extend from the town of Campbellton, N.B., to St. Leonards, on the St. John river, a distance of 110 miles. This railway will open up what has been pronounced the finest spruce areas in Canada, but which have been inaccessible on account of their remoteness from rail or river.

—The lumbering business carried on for many years on the Miramichi river, in New Brunswick, by Wm. Richards has been put into a joint stock company, known as Wm. Richards & Company, Limited. The headquarters will be at Boiestown, and the capital stock $500,000. Wm. Richards, Wm. D. Richards, David Richards, H. W. Gunter and Dow Shields are provisional directors.

—The summer activity at the Chaudiere mills has commenced. The mills of J. R. Booth, Hull Lumber Co. and Gilmour & Hughson are working to their full capacity, but it is improbable that those of Bronson & Weston and Mason & Sons will run this season. Large tows of logs arrived recently, although the first lot was three weeks later, owing to high water, than the first run made last year.

—We note the incorporation of the Lumbermen's Marine Insurance Co., of Norfolk, Va., with a capital of $50,000. The company is composed entirely of lumber firms who ship lumber by vessel, and the intention is to do a general marine insurance business. The formation of the company is said to have been made necessary by unsatisfactory conditions prevailing with the general marine insurance companies, who are claimed to have advanced rates to an unreasonable point.

—The Hardy Lumber Co. and Turner & Fisher, both Michigan concerns, recently made application to the Minister of Crown Lands to readjust the tolls levied by the Pickerel River Improvement Co. It follows that the longer the term the lighter the tolls. The charter of the Improvement Co. was for twenty-three years, but thirteen years had expired before application was made in 1895 for the arrangement of tolls. The commissioner then fixed the tolls on a basis of a ten years' sinking fund, representing the entire future life of the company. In view of this, the application of the above-named companies to adjust the tolls on a twenty-three year basis was refused.

## CASUALTIES.

—Fred Richards had one of his hands cut off in Kinlough's saw mill at Wingham, Ont.

—At Draper's saw mill at Millville, N. B., Weldon Stairs was caught in the shafting and injured to such an extent that he died in a few hours.

—Charles Dawson, foreman at Kennedy & Down's saw mill at Sycamore Siding, Ont., was instantly killed while taking a belt off the tightening pulley. As the pulley was relieved the belt struck deceased on the head.

## PUBLICATIONS.

Paul Leicester Ford, the historian and novelist, has gathered together from various sources a number of new stories of Washington, and publishes them in the May Ladies' Home Journal as "The Anectdotal Side of George Washington."

Entering upon the fifteenth year of publication, the publishers of the National Coopers' Journal, Philadelphia, Pa., have issued an appropriate and creditable anniversary number. The frontispiece is an artistic and striking design, surrounding the names of fifteen manufacturers of cooperage stock who have been represented in the advertising pages of that journal during the fifteen years of its existence. We bespeak for The Journal a future even brighter than the past.

## CANADA'S COMMERCIAL AGENTS.

FOLLOWING is the correct official list of Canada's Commercial Agents in Great Britain, British possessions and foreign countries :

J. S. Larke, Sydney, N.S.W., agent for Australasia.

G. Eustace Burke, Kingston, Jamaica, agent for Jamaica.

Robert Bryson, St. John, Antigua, agent for Antigua, Montserrat and Dominica.

S. L. Horsford, St. Kitts, agent for St. Kitts, Nevis and Virgin Islands.

Edgar Tripp, Port of Spain, Trinidad, agent for Trinidad and Tobago.

C. E. Sontum, Christiania, Norway, agent for Sweden and Denmark.

D. M. Rennie, Buenos Ayres, Argentine Republic, agent for Argentine Republic and Uruguay.

In addition to their other duties, the undermentioned will answer inquiries relative to trade matters, and their services are available in furthering the interests of Canadian traders :

J. G. Colmer, 17 Victoria street, London, S.W., England.

Thomas Moffat, 16 Church street, Cape Town, South Africa.

G. H. Mitchell, 15 Water street, Liverpool, England.

H. M. Murray, 40 St. Enoch Square, Glasgow, Scotland.

Harrison Watson, Curator, Imperial Institute, London, England.

# WOOD PULP DEPARTMENT

## THE PROCESS OF MANUFACTURING MECHANICAL WOOD PULP.*

BY W. A. HARE.

(Concluded.)

HYDRAULIC PRESSING.

DESCRIPTION OF PRESSES AND PUMPS.—When the pulp is cut off the wet machine, it contains a large amount of water. The per cent. of dry pulp in wet pressed pulp generally averages about 35 per cent. To ship pulp having this amount of water would be very expensive, as freight would have to be paid on 65 pounds of water for every 100 pounds of wet pulp shipped. In order to reduce this loss, the pulp, after coming from the wet machine, is sent to the baling room, where are situated heavy hydraulic presses, whose duty is to remove some of the water. In most of the mills in Canada the percentage of pulp is raised from 35 to 50 per cent. by means of these presses. It may be advantageous to take the pulp from the wet machine wetter than 35 per cent., relying on the hydraulic press to remove enough water to bring the percentage to 50 per cent. of pulp. Experiments should be conducted in each mill to determine the most economical degree of wetness that the pulp should be delivered from the wet machine. The style and capacity of the hydraulic press will make a difference in determining the above. Fig. 13 shows an hydraulic press, manufactured by I. Matheson & Co., Limited, New Glasgow, Nova Scotia. It is made especially for this work, and is used in a good many of the mills in the eastern provinces. The lower frame is of very heavy cast iron, containing the chamber and ram. Four large steel rods are situated, one at each corner of the frame, and serve to support the top casting, and also the whole strain of the ram. The ram is made of cast iron, of a suitable diameter, and on top of which is carried the platen. The pipes are connected to the chamber through the cast iron frame of the base.

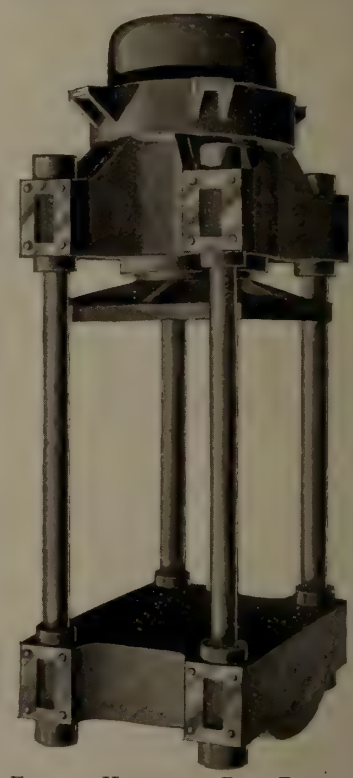


FIG. 13—HYDRAULIC PULP PRESS.
(Made by I. Matheson & Co.)

In erecting, the press is let down through the floor, so that the platen will be of a sufficient height from the floor to accommodate the trolleys. Owing to its weight, it is best to put the press on an independent foundation where possible, or else to introduce special bracing in the frame of the mill. The pressure which these presses use varies considerably, according to the size of ram and capacity of pump. In a large press a pressure of 150 tons on the ram is not unusual. The water is supplied to these presses by a triplex pressure pump, one of which is shown in Fig. 14. This pump is also manufactured by I. Matheson & Company. It is made for use in connection with the press shown in Fig. 13, and is constructed in a very substantial manner. The plunger shaft is made of steel, as shown, and is fitted with a spur gear for driving. The pump is back geared from a pinion shaft, which carries the driving wheel. The speed of the crank shaft is 40 r.p.m. The pressure at which it is capable of working is 5,000 lbs. per sq. inch. The standards, which carry the plunger shaft, are made very heavy, and are cast in one piece with the base. In order to give the plungers a true vertical motion, without creating a lateral strain on the glands, they are provided with cylindrical guides, mounted on a cross-bar which is bolted to the two standards. The pressure pump is usually placed upon the roof trusses of the wet machine room and driven from the main shaft. It is connected to the press by special hydraulic piping and fittings. A pressure gauge is placed near the press, which shows the pressure per sq. inch, and also the tons on the ram. A suitable valve is also connected near at hand for operating the press.

The overflow from the pump is led back to the water chamber of the pump, so that the water is used over

* Paper read before the Engineering Society of the School of Practical Science, Toronto, and published by permission.

again. In this way no attention is necessary to supply the pump with water. Some makers of hydraulic pumps prefer to make one of the plungers larger than the other two and arranged so that when the pressure reaches a certain limit this plunger is automatically cut out, the pump then becoming a duplex. The reason for introducing this feature is to raise the ram faster, thereby saving time and increasing the output of the press. The result is not very satisfactory, owing to various reasons. When the 3 plungers are working, they are acting 120° apart, giving an even strain on the gearing and belt. Now when one is cut out, the pump is simply a badly-

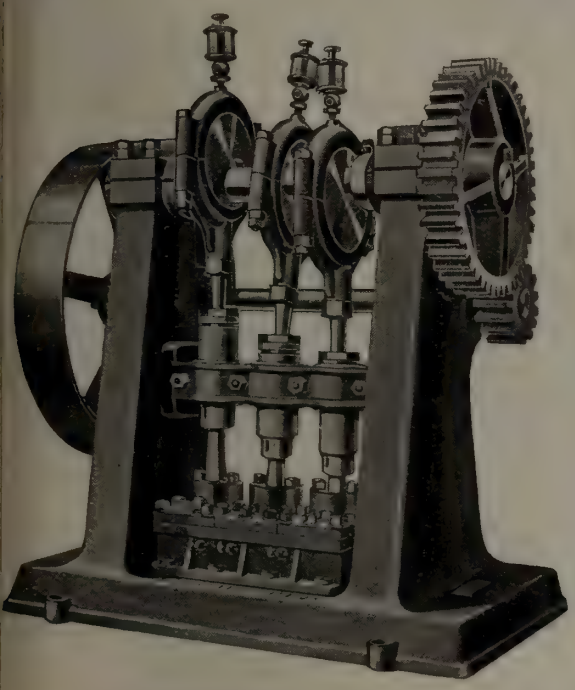

FIG. 14—HIGH PRESSURE TRIPLEX PUMP.
(Made by I. Matheson & Co.)

designed duplex, as the cranks of the remaining two plungers are not opposite each other. This causes uneven wear on the gear, and a periodic swing in the belt. If it is desirable to increase the output of the press by a special design in the pump, it would be better to have three of the plungers the same size and introduce a fourth one of larger diameter than the rest. As the three similar ones do the greater part of the work, they should be spaced 120° apart, as in an ordinary triplex, and the extra and larger one midway between any two of them. The strain on the gear and belt will not be even at first, when the load is light, but occurs when the pressure is heavy, when the pump is working properly as a triplex. There may be objections to this, but when it is remem-

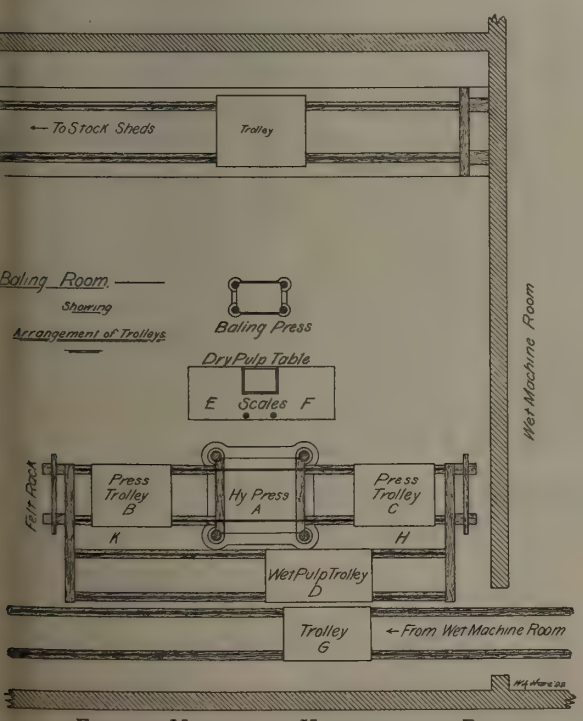

FIG. 15—METHOD OF HANDLING THE PULP.

bered that the extra plunger cuts out automatically before 10% of the total load on the pump is reached, it will be seen that it does not disturb the balance of the pump as much as it appears to do at first sight.

ARRANGEMENT OF TROLLEYS.—A very good method of handling the pulp is shown in Fig. 15. It is supposed, in this case, that the pulp is brought to the press by the trolley shown at G. The wet pulp is delivered from this trolley to trolley D, which is simply a large table mounted on a pair of wheels, so that it can be brought near to the press trolley that is being loaded, and within easy reach of the pressman. One press trolley with its load of pulp is always under pressure, the other one in the meantime being either discharging or loading with wet pulp again. The operation is somewhat as follows: The pressman, in loading trolley B, places on it first a layer of felts, then a layer of pulp, and so on alternately until the pile will just go under the top of the press. B is now run into the press and the pressure turned on. While this load is being pressed he proceeds to load trolley C, from the supply on the wet pulp table D. When B has been pressed sufficiently, the water is turned off, which lowers the trolley down on the rails again. It is now run out, and trolley C run in and the water turned on as before. B is now unloaded, the pressed pulp being thrown on the dry pulp table at E and the felts on the felt rack. When B is empty it is immediately loaded again, the trolley D being run up conveniently near for the purpose. In this way there is no carrying of the pulp by the workman, an advantage which will easily be seen when the quantity handled is considered. The rails for the press trolleys are laid across the plate of the press, and are cut at each side so that the ram can rise. The trolley is made with the distances between the centres of its wheels a few inches greater than the length of the press plate, so that when the ram rises the plate clears the axles, and bears up the trolley with its load, without causing any strain to come on the wheels or bearings. The trolley is, in this way, better able to stand the strain which otherwise would break it down at once. On lowering the ram again the wheels find the rails and it is rolled off as before stated. It is hardly necessary to mention that under these circumstances it is necessary to build the frame of the trolley very strong to stand the crushing load.

The felts used for the pressing are a good deal heavier than those used on the wet machine, sometimes being ½ inch thick. Some mills use coarse bagging instead of felts, and find them very serviceable. The open grain or texture of the material facilitates the flow of the moisture. One of the difficulties encountered by Canadian shippers to the English market is the variation in the moisture test. Export pulp is supposed to be 50 per cent. pulp and 50 per cent. water, but it will vary from time to time, even with the product of the same mill, as much as 4 or 5 per cent. above or below the standard. Steps should be taken to insure uniformity of moisture, not only in the product of any one corporation, but in that of all exporters. This is one of the many questions to be solved by pulp mill men who export. The percentage of 50 per cent. has been almost universally adopted as being the best, considering the present method of extracting the water. It is necessary, from the standpoint of freight and carriage, that the amount of water in the pulp should be reduced as low as possible. If this were all, the question would be much simpler than it is. It is extremely difficult, however, to press pulp much higher than 50 per cent. by present methods. It could be done, but the output of the press could not be maintained. Another consideration presents itself, i.e., that when the pulp is baled it is springy and often will burst the wires of the bundle when the pressure is removed. This springiness is found to increase as the percentage of pulp is increased. These difficulties can be met, but it is not along this line that the solution will be found. Inventors are at work now on the problem, and some already claim a solution of it.

BALING.

DESCRIPTION AND OPERATION.—After the pulp has been pressed to remove excess of water, it is next baled into flexible bundles for shipment. This part of the process is effected in a hydraulic baling press, which is somewhat similar in design to that shown in Fig. 13, though being of much lighter construction. On the platen of the press, and also on the under side of the cast iron cap, are bolted heavy blocks of hardwood, having grooves cut laterally in them, to accommodate the wire for binding the bundle. The same result could be arrived at by having slots or grooves cast in the cap and platen at the required places. In the process of baling, the operator weighs out a sufficient amount of pulp to contain 100 pounds dry. If the pulp is exported as 50 per cent. pulp, then the weight of the bundle will be 200 pounds. On the platen are put two wires, which lie in the grooves prepared for them. Two laths are next laid on, and on top of these a wrapper, if pulp wrappers are used. The 200 pounds of pulp being put in, then another wrapper, with two laths, is placed the same as before. The pressure is now turned on, which compresses the bundle firmly. The two wires are pushed through the top holes and twisted to the ends which pass below the bundle. On the pressure being removed the pulp expands and draws the binding wires tight, making a firm, compact bundle. It is now sent to the store sheds to await shipment.

The arrangement of the piping and connections are different in this press than in the larger one. Fig. 16 is a drawing showing the pipe connections. The accumulator is connected in the pressure pipe between the pump and the baling press valve. When the press is not in operation or the valve closed at the point H, the discharge from the pump forces the plunger and weight of the accumulator up to the top, where it is stopped. Should the pressure rise higher it will be relieved by the safety valve shown at D, the discharge from which is connected to the supply tank of the pump. If, for instance, a bale should be ready for pressing, the valve is thrown over to the position G, which connects the high pressure pipe to the chamber of the baling press, forcing the piston up and compressing the bale. This effect has been caused by the descent of the plunger and weight of the accumulator, very little coming direct from the pump. If the piston of the press is forced up far enough, simply by the direct fall of the accumulator weight, the valve may be turned to the point H, thereby stopping all communication between the pump and the press, allowing the pump to raise the accumulator plunger and weight so as to be ready for the next bundle. On the other hand, if the fall of the weight is not sufficient to run up the press piston, the valve may

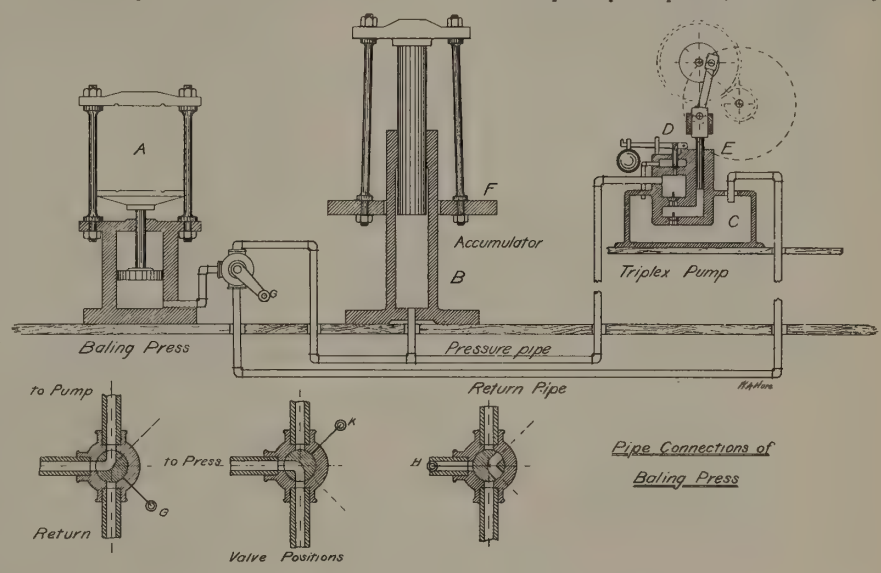

FIG. 16—PIPE CONNECTIONS OF BALING PRESS.

be left at the point G, and the pump will soon bring it up. The pressure will continue to rise until a point is reached which corresponds to that produced by the fall of the plunger, after which it will remain constant as the accumulator piston with its weight rises.

Fig. 17 shows a longitudinal cross section of the accumulator. Upon the base F stands the barrel E, which contains the plunger A, and is fitted with a gland at the top. The upper end of the plunger carries the crosshead, suspended from which is the platform D, by means of the rods B B. At G the pressure pipe is connected to the barrel. Weights are placed on the platform D D if necessary, until the pressure required to raise the plunger is equal to the pressure wanted at the press. By the use of

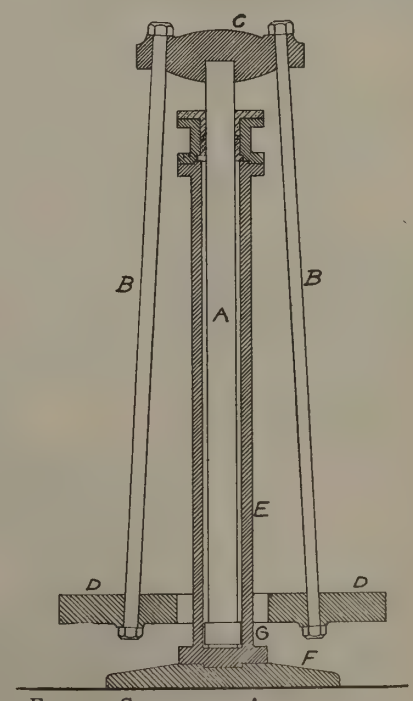

FIG 17—SECTION OF ACCUMULATOR.

this accumulator, the pump is doing effective work continually, thereby saving much time. Before the introduction of this reservoir, the operator, after opening the valve, would have to wait while the pump slowly raised the press piston and pressed the bale. Much valuable time was lost in this way, while the capacity of the press was very limited.

In Fig. 15 is shown a drawing of a baling press room. This shows a very convenient arrangement of the hydraulic press and trolleys, and also of the baling press.

The accumulator can be placed anywhere out of the way, and piped to the pump and press, the pipes running beneath the floor. The pulp table E F is situated convenient for loading and carries the scales in its centre. The size of the bale, if standard 72-inch wet machines are used, will be 24 inches long by 18 inches wide, while the height will vary according to the amount of pressing, generally about 12 inches to 14 inches. Its weight is 200 pounds if the pulp shows 50 per cent. in the moisture test.

WRAPPERS.—Owing to the loss by abrasion and dirt that is always met with when pulp is shipped without a covering of some sort on the bundles, there have been many attempts made by different manufacturers of pulp to produce a serviceable and cheap wrapper. These efforts have been made with various degrees of success, using many different materials. The best form of wrapper yet introduced is a cloth bagging of either jute or calico. In some mills where this wrapper was tried, it was given up on account of its expense. Wrappers are made in some mills of pulp. The wood used is the usual spruce, such as is used in making the ordinary grade of pulp, but after being sawn and barked, it is steamed in a steamer, under a pressure of 60 to 75 pounds per sq. in., until the wood is practically cooked. This steaming loosens up the fibres of the wood, which, when ground, produces a dark colored pulp with a longer fibre than is obtained from the raw wood. It is cut from the wet machine by a pin to secure a smooth edge, as the knife tends to crinkle the sheet. The wrappers are cut from the sheets and afterwards air dried. Two are placed on the bundle, one below and the other above, while their edges overlap. No covering is provided for the ends of the bundles when they are wrapped in this way. If more attention was given by Canadian manufacturers to secure a good cheap wrapper, which would insure their product landing in England in good condition, and also obtain uniformity in the moisture test, the demand for Canadian pulp would increase more than ever.

In conclusion, the writer desires to express his gratitude to the following firms for the privilege of presenting the accompanying illustrations :

The Waterous Engine Works Co., of Brantford, Ont.; the Jenckes Machine Co., of Sherbrooke, Que.; I. Matheson & Co., of New Glasgow, N.S.; the Northey Manufacturing Co., of Toronto; the Robb Engineering Co., of Amherst, N.S.

## PULP NOTES.

The Sturgeon Falls Pulp Co. are about to commence the building of a second paper mill at Sturgeon Falls, Ont.

It is reported that the project of building a pulp mill at St. Margaret's Bay, N.S., will be proceeded with this summer.

It is said that T. G. McMullen, M.P.P., of Truro, N.S., contemplates erecting a large pulp mill on the Salmon River, in New Brunswick.

Mr. S. A. Marks has about 17,000 cords of pulp wood to ship from the Blind river. This wood would make a pile four feet high and nearly twenty-six miles long.

The plans for the proposed pulp mill at St. John, N. B., in which Messrs. Cushing are interested, have arrived from England, and it is expected that the work of building the mill will be proceeded with at once.

It is announced that an expert will shortly arrive from England in connection with the proposal to build a pulp mill at Parrsboro, N. S. The stock of the Parrsboro Pulp Mill Co. is now being floated in London.

The town council of Woodstock, N. B., will take $50,000 stock in a pulp mill. Mr. H. E. Gillis, of Annapolis, N. S., representing English capitalists, is said to be looking into the question of building a mill there.

Mr. Chas. McCombie, pulp expert from Sweden, has been in Canada looking into the question of developing the pulp industry. Mr McCombie is said to have inspected the timber limits held by the Muskoka Mill & Lumber Co., in Restigouche country, N. B.

Incorporation has been asked for the British American Pulp & Paper Co., with headquarters in Montreal. The applicants are: Raymond Prefontaine, Robert Bickerdike, A. A. Thibaudeau, D. A. McCaskill and, E. G. Penny, all of Montreal, and the capital is placed at $3,000,000. It is proposed to manufacture lumber, pulp and paper in the Lake St John district, province of Quebec.

One of the most important projects yet undertaken in Canada is that proposed by the New Brunswick Pulp & Paper Company. This company, which is backed up by English capital, has its head office at Perth, Victoria county, N. B., and a capital stock of $900,000. The directors are Frank Lloyd, of London, Eng., T. R. Hilyard, A. H. Hilyard and H. A. Hillyard, of St. John. The company purposes erecting pulp and paper mills on the Tobique river, and carrying on the manufacture of paper and pulp upon a large scale.

# JUNE—1899

The Saw Mill Man who increases his cut this year—especially in Hardwood—will have no reason to regret it. On the contrary, will be able to make at least the price of a new mill extra, and have a snug balance besides. The

## "LANE IMPROVED" Circular Mill

will either *cut more and better lumber* than any other, with a given number of men, or will *cut as much as any other (in better manner also) with fewer men.* The saving of two men's wages alone, to say nothing of the value of increased cut and quality of lumber, will pay for a first-class "LANE IMPROVED" outfit in one year. In that way the mill repays its first cost every time.

While writing about mills don't forget, if you have water power, that

## "LEFFEL," "VULCAN" AND "PERFECTION"
### TURBINES

cover the whole field; and *what they won't bring out in power and economy is not in the water to be brought out.*

Recent reliable tests show an efficiency 5% higher than was ever claimed for these wheels, and THAT AT ¾ to ⅞ GATE. No other Turbine ever approached such a record.

# R. H. SMITH CO., LIMITED

## St. Catharines, Ont.

We are the Sole Manufacturers of Saws under the

## Simonds' Process

in the Dominion of Canada.

There is no process its equal for tempering circular saws. Other makers recognize this fact, as some of them, in order to sell their goods, claim to have the same process. **All such Claims are FALSE,** as the patentee in the U. S. and ourselves are the only firms in the world who use it.

MILL STREAM, QUE., on I. C. R'y, December 17th, 1894.

R. H. SMITH CO., LTD., St. Catharines, Ont.

DEAR SIRS,—Driving a 20 in. 13 gauge saw into frozen hardwood, using a 9 in. 4-ply belt, if it can be done satisfactorily, is a very severe test. Your saws have stood that test better than any I have tried. I have been experimenting with different makes—both home and imported—during the last five years, and give yours the preference. Last order is just to hand and will report on them by and bye.

Yours very truly, JAMES McKINLAY.

CAMPBELLTON, N.B., Nov. 17th, 1894.

R. H. SMITH CO., LTD., St. Catharines, Ont.

DEAR SIRS,—In regard to your Shingle Saws, you can say that I have been using Shingle Saws of your make (Simonds) for the past four years, and they have given good satisfaction. I am running nine machines and use a good many saws, but have never had a saw yet that did not work satisfactorily. Before using your saws I used saws of American make, which worked well, but after giving your saw a trial have continued to use yours, as they are cheaper, and in regard to working qualities are all that is needed.

Yours truly, KILGOUR SHIVES.

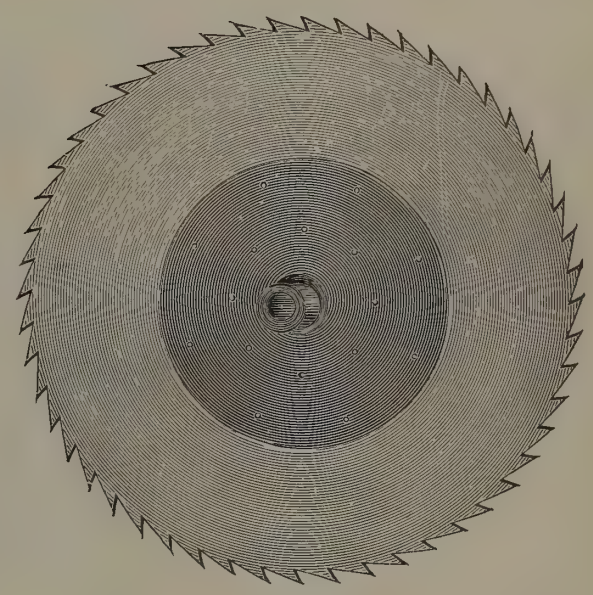
CLAVERING, ONT., May 3rd, 1897.

R. H. SMITH CO., LTD., St. Catharines, Ont.

GENTS,—In reply to your letter asking me how I liked the 62" SIMONDS Saw, I must say in all my experience I never had a saw stand up to its work like the one purchased from you last month. Having used saws for the last 22 years, and tried different makes, I can fully say it is the best saw I have ever had in my mill, and would recommend the SIMONDS' Process Saws to all mill men in need of circular saws.

Yours truly, W. G. SIMMIE.

P.S.—I am sending you my old saw to be repaired; please hammer to same speed as new one. W.G.S.



## THE "LEADER" CROSS-CUT SAW

These Saws are made from the best DOUBLE REFINED SILVER STEEL, warranted four gauges thinner on back than front, and the only Saws on the market that are a perfect taper from the points of the teeth to the back, and require less Set than any other Cross-Cut Saw.

They are tempered by the Simonds' Patent Process, insuring a perfectly uniform temper throughout the plate, and stand without a rival as the BEST, FASTEST, AND EASIEST-CUTTING SAW KNOWN. A gauge to regulate the clearing teeth is furnished with each saw.

Directions for Setting and Filing are plainly Etched on every Saw. None genuine without our Registered Trade Mark as shown in cut.

## THE "LEADER" SAW SWAGE

**Made in 3 Sizes—$2.00, $2.50, $3.00 Net.**

## CHARACTER SKETCH.

### HON. PETER WHITE.

IT affords THE LUMBERMAN much pleasure to present to its readers a portrait of Hon. Peter White, together with some particulars of his active and useful life. Mr. White is a son of the late Lieut. Col. Peter White, a native of Edinburgh, Scotland, who came tc Canada and founded the town of Pembroke in 1928, and was for years one of the principal lumber merchants of the Ottawa valley. Born at Pembroke in the year 1838, the subject of our sketch was educated at the local schools, receiving his business training in a mercantile house in Ottawa. In 1858, in partnership with his brother, Mr. A. T. White, he embarked in the lumber trade, the firm name being A. & P. White. This partnership has continued ever since. For many years their business was chiefly confined to the production of square and waney timber in the Ottawa valley, but latterly they have been engaged in the manufacture of sawn lumber. Their mills are located at Pembroke, and have a capacity of about six million feet per annum. The members of the firm are also shareholders and directors of the Pembroke Lumber Company, which have extensive saw mills in the same town.

Mr. White has devoted much time and energy to advancing the interests of the town of Pembroke, and aided very materially in promoting the Kingston & Pembroke railway. He was first elected to the House of Commons for North Renfrew at the general election in 1874, and with the exception of one session, continued to represent that constituency until 1896, when he was defeated by Mr. Thos. Mackie, M. P. For some years he was chairman of the Standing Committee on Agriculture and Mining, and during the Seventh Parliament, 1891 to 1896, held the office of Speaker. He was appointed a member of the Advisory Board of the Liberal-Conservative Union of Ontario in 1896, and in March of the following year was called to the Privy Council of Canada. He is president of the Pembroke Electric Light Company and of the Crystal Gold Mining Company, and a director of the Pembroke Lumber Company, Pembroke Navigation Company, and the Tobique Gypsum Company. His senior partner, Mr. A. T. White, M.P.P., was elected to the local legislature of Ontario at the general election of 1898.

## EXACTLY SO.

An "ad." in a trade journal will do what traveling men, as a rule, do not do. It will go to towns off from the railroad, where there are no hotels. It will work nights, Sundays and holidays, in wet weather or dry, hot weather or cool. It will talk to the merchant before some of the boys are out of bed in the morning and after they have gone to bed at night. It's one of the few things that has not as yet struck for eight hours.

## CANADIAN WOODS IN GERMANY.

IN a report on the subject of American woods in Germany, the Consul of the United States at Bremen writes to his Government pointing out some curious features of German trade. For example, in the April consular report, he says that the freights charged on non-European woods average from 41 to 47 per cent. higher than those on European woods. The longer the distance, the higher becomes this indirect tax. The difference is especially detrimental to American walnut and hickory, while American oak can be sent to South Germany only over the waterways. Mr. Lange gives some hints as to shipment of lumber which may be worth the observation of Canadian exporters. Although Canada's trade in lumber with Germany is very

HON. PETER WHITE.

small, it has shown signs of increase in the last three years. It is recommended by this American consul that: The boards and balks must be more carefully (i.e., slowly) dried, thus avoiding dry rot; that exporters must be more prompt in fulfilling their engagements; and that sea freight should be kept down as low as possible throughout the year. This might be accomplished by a combination of exporters. The woods cannot stand, he says, a freight of more than 18 cents per hundred pounds to Bremen and 15 cents to Rotterdam. Higher freights prevent a larger import.

As to what kinds of American wood the Germans want, Mr. Lange says that the white maple is liked, and the required white color can be obtained by a careful treatment of the wood, which will repay the trouble. It is imported in balks and blocks. The consumption of white wood (poplar) grows steadily in Germany. It is the most suitable material for many purposes, such as carriage making, construction of pianos, etc. Stout blocks of first-class quality are preferred. Small trunks are cut to much greater disadvantage in Germany than in the United States.

Hickory would be much more imported by the Germans if the exporters would adhere more to the wishes of the market. Split hickory for making spokes is hardly offered at all, although there is always a demand for it. American cherry makes very slow headway in Vaterland. The beautiful quality of this wood should make it more popular; but the prices asked for it are high. Pitch pine, yellow pine, and Carolina pine have a constant demand. It is highly advisable for exporters to take care in sorting these.

## TIMBER ELECTRICALLY SEASONED.

THE process of seasoning and preserving wood by electricity, which has of late attracted much attention, has many points of advantage which are likely to go a long way toward insuring the ultimate success of the method. One great recommendation of the new system is that certain woods which are at present used only for fire wood, since they will not stand seasoning in the ordinary way, can thus be rendered available for structural work. Among the specimens exhibited to illustrate this quality are some species of larch, very common in France, but hitherto quite unusable in carpentry, owing to the extent to which shakes developed in seasoning. The specimens were perfectly sound, and both heart and sap wood could be planed with equal ease and efficiency. The treatment makes the wood absolutely impervious to damp and prevents its decay. Another advantage of the method is that, so far, none of the large class of wood-destroying or wood-puncturing insects have been known to attack wood electrically seasoned. Even now more than 25 cubic feet can be cured for one cent, and the process is of the kind that will naturally be cheapened. The wood to be treated is placed on rests in a tank containing a solution of 10 per cent. of borax, 5 per cent. of resin and 5 per cent. of carbonate of soda. A heavy current is turned on, which causes the solution to be sucked from the bottom to the top, and the whole mass of wood permeated by the combined resin, borax and soda, through electrocapillary attraction. The resin seals the fibers of the wood after cooling, and the boric acid acts as an antiseptic. The sap displaced from the wood rises to the surface of the bath during the operation, and the resin in it mixes with that in the solution. The time required for the operation varies from five to eight hours, according to the nature and state of the wood under treatment, green wood being easier to treat than wood nearly dry.

## ONE DOLLAR PER YEAR.

This is the subscription price of the CANADA LUMBERMAN, including both weekly and monthly editions. Every lumberman in the Dominion should be a reader of this journal. Drop a postal card for sample copy.

## A LOGGING LOCOMOTIVE.

We illustrate on this page a logging locomotive of rather novel design. This machine was designed and built by the Robb Engineering Company, of Amherst, N.S., for Mr. Emile Stehelin, formerly of Paris, who has emigrated to Nova Scotia and taken up an extensive tract of timber land containing valuable spruce and other woods, which he manufactures into dimension timber and deals for export. The locomotive is used for hauling the lumber from the mills at Nouvelle France, N.S., to the point of shipment at the port of Weymouth, N.S., about 15 miles, over which Messrs. Stehelin & Sons have constructed their own railway and laid it with timber rails from the adjacent forest.

The boiler has a cylindrical shell and furnace, the smoke box end being set about two feet higher than the front end in order to assist the circulation and draught. The furnace is arranged for burning wood, and two-inch tubes connect the back end of the furnace with the smoke box in the ordinary way. The shell is completely filled with water around the furnace and tubes, steam space being provided in a large dome.

Logging Locomotive Built for Mr. Emile Stehelin, New France, N.S.

The water spaces and base of dome are so arranged as to give a rapid and continuous circulation; the ascending current of water and steam being around the furnace and tubes up to the dome, and the descending current flows from the sides of the dome around the tubes to the bottom of the boiler. This form of boiler has been manufactured for several years by the Robb Engineering Co. for portable purposes, and has proven to be a remarkably quick and economical steamer, its simplicity and freedom from stays rendering it very durable. The driving wheels are made to conform to the wooden rails, having flanges both outside and inside, the tread being slightly conical in order to run freely around curves.

The engines are of the ordinary side crank type, with balanced valves and link motion, both engines being attached to a frame which supports the boiler and rests upon the main driving axles. The engine shaft is fitted with a steel pinion geared four to one, with an intermediate shaft carrying sprocket wheels, which drive from it, by heavy forged steel sprocket chains, to the driving axles. The entire locomotive, except the driving wheels and axles, is carried on springs, which permit the wheels to follow the unevenness of the track and lessen the jar on the engines and other working parts, flexibility in the driving gear being provided by the sprocket chains.

The principal dimensions are as follows: Boiler shell diameter, 3 ft. 4 in.; length 10 ft. 6 in. Furnace diameter, 2 ft. 10 in.; length, 5 ft. 6 in. Number tubes, 109; diameter, 2 in.; length, 5 ft. Dome diameter, 3 ft.; height, 3 ft. 4 in. Total heating surface, 316 square ft.; working pressure, 125 lbs. per square in.; engine cylinders, diameter 9 in., stroke 10 in.; driving wheels diameter, 3 ft.; total weight, not including water in boiler, 22,000 lbs.

## A BANK MANAGER ON LUMBER.

Mr. Geo. A. Cox, general manager of the Bank of Commerce, in his annual address delivered in Toronto last month, spoke regarding lumber as follows: "Our lumber industry, after the effects of several years of general depression in trade and of unfriendly legislation on the part of the United States, has entirely recovered its tone, and apparently nothing hangs over the market except the threats of the United States lumber lobbyist to engineer further adverse legislation, in order, if possible, to keep the consumer in the United States at the mercy of the owners of the rapidly-diminishing supply of timber now left in that country. This unfriendly legislation hurt us for some years, but with the improvement in business the demand for low grades of lumber has been such as to clear out our yards to make the immediate outlook quite satisfactory. The demand for lumber of the higher grades continues to be good, and year by year the proportion we are able to export in a more advanced condition of manufacture than that of mere square timber or deals increases.

"The trade in doors, sashes, furniture, etc., is steadily growing, and with the exportation of sawlogs practically at an end, we may hope that out of our remaining forests in Ontario a much larger proportion of wage-earning from the same quantity of lumber will accrue to our people than in the past. As the best of our pine and hardwoods is being cut we are finding use as lumber for many woods hitherto despised, and with the development of our water-power for the making of cheap pulp, to be put doubtless to many uses not now thought of, we may look forward to national revenues and manufacturers' profits from our forests for all time to come. Permit me once more, however, to urge the necessity of adequate forestry laws. The Government is, I am aware, taking more advanced views than hitherto, but it seems very desirable, now that we have the sharp experience of provincial taxes resulting from declining crown dues from timber, to create a public sentiment which will demand forestry laws as advanced as those of any other country. In British Columbia, where, because for the moment timber seemed to have little realizable value, vast areas have been burned, the future of lumbering looks more prosperous than at any time in the past, and we may hope that it will take its place as one of the safe and permanent industries of that province."

## THE MANUFACTURE OF EXCELSIOR.

Excelsior is a staple article used largely for mattresses, upholstering, furniture, carriages, etc.; also for packing glassware, china, druggists' goods, hardware, toys, confectionery; in fact, its uses for packing are almost unlimited, and it is much preferred to hay or straw, as it is elastic, odorless and free from dust and dirt.

It is a wood shaving manufactured from basswood (which is the best), balm of gilead, white poplar and similar woods having a light colored, straight and tough fibre.

By far the greater quantity of excelsior is cut from 1/32 inch to ⅛ inch wide and about 1/100 inch thick. However, it is manufactured from 1/64 inch wide by 1/400 of an inch to ½ inch wide and 1/50 of an inch thick.

The wood should be cut in 38 inch lengths, and split into slabs 5 or 6 inches thick, the full width of the log, and then seasoned in the open air until dry. Green or damp wood is unsatisfactory; it does not work up good, clogging and otherwise interfering with the work, and molding in the bale when pressed. Wood should be full thickness that the machine will take to get full capacity of knives at each stroke.

To get the best results, open sheds with board roofs should be constructed so that the air will have free circulation, and at the same time keep the wood free from rain or snow.

After seasoning thoroughly, the 38 inch lengths are cut in two in the middle, and the ends trimmed square so as to make 18 inch lengths. The small pieces of bolts left from cutting excelsior are used for baling strips. Open air seasoned wood is preferred to kiln dried wood; the latter is more or less brittle.

An abundant supply of timber which can be handled without too great expense, together with proper shipping facilities, are, of course, the primary considerations. When the mill is located on the banks of a river, the logs may be cut many miles above, and "driven" when the water is high. Hauling by rail is also profitable when the distance is not too great.

There are many establishments throughout the country engaged in manufacturing that have a surplus of fuel for power which could be utilized for this purpose. When close to a supply of suitable timber, it is easily seen what a profit may be derived by adding an excelsior mill. Until recently, it was thought that this was the only way excelsior could be manufactured profitably, but the fact that plants erected exclusively for its manufacture find it necessary to enlarge from time to time to enable them to keep pace with the demand, proves conclusively that such is not the case. In fact, there are few better paying manufacturing businesses than this is when properly handled. — National Coopers' Journal.

I RECENTLY met a dealer who was a bold advocate of uniform inspection rules for the grading of hardwood lumber. In relating his experiences to show the necessity of such rules, he pointed out one case fresh in mind. A certain manufacturer had some hardwood lumber for sale, and the dealer visited the mill for the purpose of inspecting the stock and making an offer for it. When some boards with heart in the centre were reached, he proceeded to class them as culls, in accordance with the inspection adopted in the Eastern States, which distinctly states that all lumber containing heart defects must be classified as culls. To this the manufacturer took exception, contending that certain local industries accepted such boards as common, measuring out the strip in the centre containing the heart and rejecting it entirely. While the dealer pointed out that this was not the proper inspection, he had no authorized rules to prove his position, and was therefore somewhat at a disadvantage. He states that when lumber is shipped for inspection upon delivery, he frequently finds that the mill man has not been accustomed to selling upon any proper system of rules, and in cases where disputes over inspection arise, there are no standard rules which can be referred to to facilitate a settlement. His opinion is that if hardwood manufacturers would properly grade their lumber, they would in the end receive greater returns and would be saved the annoyance of many disputes such as now arise. Even if certain buyers continued to buy upon their own inspection, and the rules were not generally adopted, they would at least be of advantage in the way of providing proper rules as an authority to which to refer. The trouble, he thinks, with all rules in existence to-day, is that they are not explicit enough.

* * *

IN the Maritime provinces of Canada, and also in the state of Maine, there has been growing up for some time a new industry; more correctly speaking, perhaps, not a new one, but an old one assuming larger proportions. It is that of spruce gum gathering. Years ago the country lad who went into the city was highly indignant when called after by the small boy, "Johnny from the country, with his pockets full of gum." Literally, this was true then, "Johnny" usually having a few chunks with which to treat his friends. Now, however, many persons are engaged in this pursuit. There is a large market for the product, notwithstanding that the prejudice against gum chewing far outweighs anything that might be said in its favor. The gum picker usually goes into the woods with the lumbermen in December, and makes his home at the lumber camp. Before doing so, he provides himself with a ladder and a knife with a long blade. This is all the outfit required, excepting that, perhaps, when the snow is deep, use is made of snowshoes. The spruces usually are without branches at the base, and instead of climbing the trunks the ladder is used. Of course, the ladder could be made in the woods, but spare time is employed doing this before entering the forest. Once there, the picker finds plenty to do. He rises early from his bunk, and it is not very late in the afternoon when "the shadows of evening fall," and then his day's work is done; but the employment makes him quite tired and ready to retire early. Each day his work takes him farther from the camp, but, in truth, he need not be far away at any time, gum-bearing trees being all around. If the picker has had good success, he has made a fair day's pay. Spruce gum is sold at wholesale from 60 cents to $1 a pound, according to quality; and as it is not uncommon to gather from three to five pounds during the day, it can be seen that the work nets him a tidy income, the cost of living at the camp being comparatively small. The lumbermen, too, find time Sundays to turn their hands to this work. It is the custom then to go in a party of a dozen or more to where the logs are "browed." Here it is possible, with the aid of a peevie, to get at the gum more readily. The wholesale druggists in New York, Boston, and some of the other large cities, are the largest purchasers. Some of these firms employ pickers, while others depend on agents to purchase their supply. In the cities mentioned, spruce gum retails for about 16 cents an ounce. When the crop is being harvested, the dealers have difficulty in keeping pace with the demand. The other day a New York firm sent an order for a ton. Their agent was unable to fill the order, but sent all he had on hand—some 300 pounds—assurring his customer that he would be able to fill the balance of the order in a short time.

* * *

IT is always interesting to compare the customs in Canada with those prevailing in other countries, but particularly in Great Britain, to which country, it might be said, we look for counsel and instruction. A gentleman from England closely associated with the lumber trade who has recently travelled through Canada and the United States, in a letter to the scribe, comments on his trip, and for the benefit of readers of this page, I will give his concluding remarks, from which some ideas may be gathered. He writes: "I found trade good everywhere in lumber, and have visited quite a number of box and case-making manufactories both in Canada aud the United States. The courtesy and kindly interest shown to me on all sides will always conduce to very pleasant recollections and memories of my first visit to Canada and the States. I am taking back a few machines and labor-saving contrivances, which are more in evidence here than in England. Generally, however, owing to the greater advertising facilities of recent years, I have not found very many machines of whose merits I was not already acquainted, but I have been much struck with the intense energy evinced by all on this side of the water, greater in the States, and existing in a lesser degree in Canada also. Doubtless to this must be attributed much of the wonderful advances made here during the last twenty or thirty years. In the matter of lumber, I was struck with the fact that while in England we mostly deal with lumber in the form of planks, deals and battens, in Canada and the States it is almost all in the form of boards. Owing to your mills sacrificing quality to quantity, these boards are generally too roughly sawn to suit the English market, and to this in part I attribute the difference that exists in this respect. The extra labor of handling boards over deals and battens is offset here by great attention to labor-saving devices, while the advantage in the quicker drying is very obvious. In view of the preference given here for sawing the lumber into boards at the mills, with a little more care in the accuracy in size and chances of saving therefrom, I should not be surprised if the exports of the future tended more toward boards and less of deals, battens, etc."

## TO PREVENT SHRINKING OF FLOORS.

A WRITER on the above subject in the Mississippi Valley Lumberman says:

"The flooring mostly used for homes is oak and birch. Maple is used almost exclusively for stores and office buildings. As to which one of these woods is most liable to shrink when used on the floor I don't really know. Birch has the general reputation of freely contracting, and many think that maple being so hard and close grained will not shrink; but in my experience I have had some cases the equal reverse of this. I believe, however, that if extra care were exercised in keeping maple flooring from contact with the moisture in the air it would not shrink. The manufacture of maple flooring has been figured down to a science. I have a lot of No. 2 that has just come in. It is from 4 to 16 feet in length, and a few years ago it would have passed muster as No. 1 clear. The end matching permits the use of short lengths without serious detriment to the floor. This lot seems to have been kept in good condition and to be thoroughly dry. I have seen cars containing maple flooring that were open to the weather and pretty well soaked with rain. Some dealers store their stock in open sheds too, and I am only surprised that under such circumstances it proves as satisfactory as it does. Maple flooring is never put through a dry kiln after it leaves the factory and is often not laid for many months after it is manufactnred. Oak and birch flooring on the contrary are usually not made until the order is secured. Many carpenters think it necessary to take such flooring smoking hot from the dry kiln and lay it down before it is fairly cool. This is a mistake. All lumber after being kiln dried should be allowed to stand some time before being used. After coming from the kiln all wood will naturally absorb a certain amount of moisture from the air. This will expand it somewhat, but if allowed to remain in a dry place some days it will again contract and become very durable in staying qualities. Most of the sash and door factories appreciate this fact and act accordingly.

## ONE DOLLAR.

THE above sum represents the yearly subscription price of the CANADA LUMBERMAN, including both weekly and monthly editions, mailed to any address in Canada or the United States. Owing to postal charges, the subscription price to foreign subscribers is two dollars per year. Persons in foreign countries interested in Canadian timber products can invest that sum to no better advantage than by becoming a subscriber. Likewise every mill owner in Canada should read the columns of the CANADA LUMBERMAN. A sample copy will be furnished upon request.

One Copy, Weekly and Monthly, Six Months, in advance..... .50
Foreign Subscriptions, $2.00 a Year.

ADVERTISING RATES FURNISHED ON APPLICATION

THE CANADA LUMBERMAN is published in the interests of the lumber trade and allied industries throughout the Dominion, being the only representative in Canada of this foremost branch of the commerce of this country. It aims at giving full and timely information on all subjects touching these interests, discussing these topics editorially and inviting free discussion by others.

Especial pains are taken to secure the latest and most trustworthy market quotations from various points throughout the world, so as to afford to the trade in Canada information on which it can rely in its operations.

Special correspondents in localities of importance present an accurate report not only of prices and the condition of the market, but also of other matters specially interesting to our readers. But correspondence is not only welcome, but is invited from all who have any information to communicate or subjects to discuss relating to the trade or in any way affecting it. Even when we may not be able to agree with the writers we will give them a fair opportunity for free discussion as the best means of eliciting the truth. Any items of interest are particularly requested, for even if not of great importance individually they contribute to a fund of information from which general results are obtained.

Advertisers will receive careful attention and liberal treatment. We need not point out that for many the CANADA LUMBERMAN, with its special class of readers, is not only an exceptionally good medium for securing publicity, but is indispensable for those who would bring themselves before the notice of that class. Special attention is directed to "WANTED" and "FOR SALE" advertisements, which will be inserted in a conspicuous position at the uniform price of 15 cents per line for each insertion. Announcements of this character will be subject to a discount of 25 per cent. if ordered for four successive issues or longer.

Subscribers will find the small amount they pay for the CANADA LUMBERMAN quite insignificant as compared with its value to them. There is not an individual in the trade, or specially interested in it, who should not be on our list, thus obtaining the present benefit and aiding and encouraging us to render it even more complete.

## MANUFACTURING HARDWOOD LUMBER.

IN the production of lumber, manufacturers should aim to obtain from the log as much saleable stock as possible, and at the same time the greatest percentage of higher grades. Pine manufacturers, being engaged in the business on a comparatively extensive scale, generally manufacture their logs to the best advantage, and this may also be said of many hardwood manufacturers. But it is also true that some operators in hardwood give little attention to the question of manufacture, as is evidenced by the class of stock to be found in their yards. They frequently sacrifice, unknowingly, quality to quantity, and as a result are compelled to market their lumber at a much lower price than might be obtained if it were carefully manufactured.

The natural inference would be that the poorly manufactured stock would be found in the yards of persons who had but recently launched into the lumber business. This is not always the case, as persons of the last mentioned class give more attention to studying the market requirements than do some saw mill owners who have been in the business for years. These latter are averse to changing their established methods, and unless someone becomes sufficiently interested to go into the question very carefully with them, and point out how their annual profits can be increased, they continue to follow their own ideas.

A method of sawing hardwood lumber which some mill men adopt is to cut a slab and couple of boards from two sides of the log, than give it a quarter turn and saw continuously from one side until the log is cut up. The result of this method is that several boards contain heart in the centre, and must therefore be classed as culls.

A method of sawing which we believe to be an improvement on the one above referred to, is to turn the log to the saw and work down until the hearts defects are reached, then give the log a half turn and work down from the other side in the same way. This leaves a portion of the log on two sides of the heart to be sawn into strips, the heart being removed entirely from the lumber, to be thrown away if worthless. An objection to this manner of sawing is the great amount of edging it necessitates, taxing the capacity of the machine where only one edger is in use. In the case of large logs this may be overcome by cutting boards off the four sides until it is possible to get a perfectly square board, and then proceeding in the manner as above described. With small logs, however, the use of this method might so reduce the width of the lumber as to make its adoption undesirable, in which case we would recommend that the edging be done by a circular.

The method above advocated has additional advantages besides that of producing a greater quantity of high grade lumber. For instance, with birch it is desirable to obtain as much red faced lumber as possible, in view of its greater value. With this method this result is effected, the bulk of red face in the log coming out almost as separate boards.

There are some who contend that not more than from ten to twelve per cent. of red face can be obtained from birch timber, yet the writer is cognizant of an instance where, by careful sawing, ten thousand feet, or more than 17 per cent. of first-class red face lumber, was gotten out of a total cut of less than sixty thousand feet. When it is rembered that the commercial value of red birch is about double that of ordinary white birch, the wisdom of giving attention to the science of manufacturing becomes clearly apparent.

## LEGALITY OF THE MANUFACTURING CLAUSE.

The indications at the present time are that the courts will be asked to decide as to the legality of the Ontario legislation compelling the home manufacture of timber. Messrs. H. J. Scott, Q. C., and Christopher Robinson, Q. C., two emminent lawyers, have been engaged by the Michigan lumbermen to endeavor if possible to obtain a test case in the courts, and have applied to the Attorney-General for his consent to take such proceedings. This consent will in all probability be granted, and it is expected that the case will be heard in the Ontario courts in the fall, and will reach the Privy Council early in the winter.

This question as to the right of the Ontario government to impose restrictions governing the cutting of timber on crown lands has been the subject of more discussion than perhaps any question which has come up for some years, and it is indeed satisfactory to know that it promises to be finally disposed of in the near future. As to the result, Canadians generally have little fear, feeling confident that the course which has been taken will be upheld by the Privy Council. To the Michigan lumbermen who are now refused the right to export logs we extend our sympathy. At the same time, it is the United States Congress that is reponsible for their present position. This is very clearly set forth by the Toronto Globe in the following words:

"Until the passage of the Dingley bill the Dominion Parliament refrained from putting an export duty on logs, while Canadian lumber was admitted, sometimes free, sometimes at a rate of $1 per thousand. The Dingley act made a new arrangement. It placed a duty of $2 a thousand on lumber, and it provided that if Canada, or, to be strictly accurate, any country imposed an export duty on logs, an amount equivalent to that duty should be added to the import duty on lumber. That was a highly ingenious plan for taking all the advantages of the situation and giving none. But it is not a matter of surprise that the Ontario lumbermen chafed under it and were glad to find an equally ingenious method of meeting it. This was the provision requiring the manufacture of all logs cut on Ontario limits into lumber before export. It answered the same purpose as an export duty, and it did not involve the same consequence. It was, in our opinion, as a measure of defence and of meeting the unfair provision of the Dingley law, a perfectly justifiable measure, and the Ontario lumbermen were always willing to make a fair arrangement, namely, reciprocity in logs and lumber."

We believe the government of the United States have acted unwisely and against the interests of the country. With the forests rapidly becoming depleted, it is only a matter of a short time until the wood-consuming industries will be largely dependent upon Canada for a supply of timber. In the meantime, influenced by public sentiment and unfair legislation at Washington, the Dominion government may have passed a law preventing the export of logs from Canada under any conditions. This matter was last week brought up in the House by Mr. Bennett, who spoke strongly in favor of such action.

## EDITORIAL NOTES.

IN last issne reference was made to the dispute over the lease of Deadman's Island as a site for a saw mill. Within the past month the officials in the Militia Department at Ottawa have discovered the missing document, which shows that the title of the island belongs to the Dominion government. Meanwhile, however, Mr. Ludgate, tired of the fight, is reported to have gone to Puget Sound to establish a saw mill.

IT may be stated without fear of contradiction that no wood has as yet been discovered possessing the excellent qualities of spruce for producing mechanical pulp. It has qualities not found in other woods, particularly its long and tough fibre. Nevertheless, it is possible that science will yet make such discoveries as will permit of other woods being utilized for the manufacture of a good grade of pulp. At the present time many persons are turning their attention to hemlock, and experiments have been made with it by two or three Canadian mills, but with what success has not been learned.

THAT gigantic, but none the less desirable project, the Ottawa and Georgian Bay canal, may yet be carried to completion. When in England recently, Mr. Stewart, the promoter, claims to have formed a company to undertake

the work, and it is said that the company have since deposited with a Canadian bank the sum of $200,000, in accordance with the provisions of the statute incorporating the company. Further developments will be awaited with much interest, as the construction of the canal will certainly prove of much benefit to Canada, and be a boon to the lumber industry of the northern couutry.

It is indeed gratifying to learn that both the Imperial and Dominion governments have decided to grant Messrs. Pickford & Black substantial subsidies for a fast steamship service between Maritime province ports and the West India islands. These islands are gradually becoming of more importance from a commercial standpoint, and conditions being favorable to an interchange of products with Canada, a considerable increase in the volume of trade may be looked for. The appointment of a Jamaican commercial agent at Ottawa is also a step in the right direction.

## THE PATCHING OF CRACKS IN BAND SAWS.

By J. S. Jackson.

It is probable that there is no band filer who has not had considerable trouble in the fitting of band saws by reason of the cracks, which occur variously both on the back and toothed edges, and occasionally also in the central portions of the saw. It is unnecessary here to take up the question of the causes for the formation of these cracks, as they are many and varied, and a treatment of the subject would make in itself a long article. It is obvious that with any band filer having troubles of this kind the most important thing for him to do is to look to the prevention rather than to a remedy for the cracking. But having cracked saws, the question arises, "how can the cracks best be remedied?"

Where a few or a considerable number of short cracks form on the back edge of the saw, or perhaps also on the front edge, extending in but a short distance, one of the most common remedies is to shear the back edge, if that edge is affected, or to shear and retooth the front edge if that side is affected. There are instances where this process will prove the only successful remedy, and where it is necessary to remove only a very narrow strip it will not materially impair the saw by lessening its width. But there are occasions when these cracks extend in for a distance of an inch or an inch and a half, or perhaps further, and in such a case the remedy of shearing would work a serious loss to the saw, and the filer therefore resorts to cutting the saw in two and brazing it. But cutting and brazing band saws, if the process can be avoided, is highly objectionable, by reason of the fact that it involves a considerable amount of labor and skill to effect a successtul braze, and it leads to the shearing of the saw and usually to an impairment of the life of the saw.

It would seem, therefore, that any method calculated to reduce the necessity for cutting and brazing must recommend itself strongly to both mill men and saw filers. Such a process consists of putting a patch on the saw over a crack, in such a manner as to largely restore the integral character of the saw and at the same time in no way diminish its life or strength, as is likely to result from a complete cutting and brazing. A band saw patch is simply a short braze. The patching of band saws has been practiced by numerous filers for a number of years, but heretofore they have performed the process entirely by hand, having no machines or tools with which to render the process easy, simple and exact, hence the hand method has not been largely adopted and never will be.

The difficulty of patching a crack by hand will be readily apparent when one considers that two bevels must be filed in the saw plate, tapering to the crack on opposite sides, and also from the central portions toward the end of the crack, and a piece of steel filed accurately to fit this portion of the plate thus filed away, before the ordinary process of brazing is resorted to. In view of the fact that in a large number of band mill filing rooms there have hung in the racks, unused, band saws that have been condemned as worthless by reason of the cracks in them, it is perhaps a wonder that some makers of saw fitting machinery have not long before this developed a machine which would render the preparation of a cracked saw, and of suitable patches for same, a simple, easy and successful process. I am glad to learn that one of the concerns making filing room machinery has recently placed on the market a machine which will very quickly prepare a cracked saw ready for patching. By their method the surface of the saw along the edges of the crack is milled to the proper bevels, and strips of saw steel, of proper gauge, according to the requirement, are furnished in length as desired, so that the operator has nothing whatever to do except to prepare the crack and then apply the patch, brazing it on in the same manner as the ordinary braze is effected.

In brazing on a patch, the heated irons are applied only on the surface of the patch, and no other portions of the blade are affected. It is a much easier and quicker process to prepare the saw for a patch an inch long, more or less, than to prepare two laps the width of the saw. It is easier to straighten up a patch than a braze, as you have only from an eighth to a sixteenth as much surface, as if the patch is properly brazed on the saw becomes practically as good as new. I would advise any mill man or filer who is interested in this process to look into the machine referred to above, which is made by Baldwin, Tuthill & Bolton, Grand Rapids, Michigan, and which is illustrated in their catalogue for 1899. —The Wood-Worker.

The mill of the Riordan Pulp Company, at Hawkesbury, Ont., will commence operations at an early date. The daily output is to be forty tons up to the first of next January, after which it is to be eighty tons. There is a mistaken impression that the product of this mill is to be ordinary sulphite pulp, such as is used in news. It is, however, to be a superior book pulp. It appears that the Riordans discovered, when marketing in the United States the surplus of the Merritton mills, that the grades affording the most profit were the higher ones. They found competition too keen in the ordinary qualities, and therefore kept exclusively to the finer kinds. The twenty tons per day that they could spare from the Merritton mills have been disposed of in the United States for more than the last twelve months, and it was a class of pulp that could be used for book paper. This quantity from the old mill will continue to be marketed across the line, as well as the whole output of the new mill. At Hawkesbury, production will be cheaper than at Merritton. For the Merriton mill wood had formerly to be brought all the way from the north shore of the Georgian Bay, and cost about $6 per cord laid down. At Hawkesbury, contiguous to the company's own limits on the Rouge, wood will cost not more than $2.50 per cord delivered.

## TRADE OPENINGS.

The following were among the enquiries relating to trade matters received at the High Commissioner's Office in London, Eng., during the week ending June 17th, 1899:

An enquiry from Budgett Bros., 70 Bishopsgate St. Within, E. C., for a good manufacturer of dining tables made from birch, spruce, and basswood, in quantities and shipped in the white.

An enquiry from C. L. Miller, 117 Bothwell St., Glasgow, for shippers of hickory suitable for golf sticks, in lengths of 44" by ⅞" square. The goods are required immediately for wholesale trade.

## THE SONG OF THE SAW.

The song is the shriek of the strong that are slain—
The monarchs that people the woodlands of Maine;
'Tis the cry of a merciless war,
And it echoes by river, by lake and by stream,
Wherever saws scream or the bright axes gleam—
'Tis keyed to the sibilant rush of the stream,
And the song is the song of the saw.

Come stand in the gloom of this clamorous room,
Where giants groan past us a-drip from the boom,
Borne here from the calm of the forest and hill,
Aghast at the thunderous roar of the mill,
At rumble of pulley and grumble of shaft,
And the tumult and din of the sawyer's rude craft.

Stand here in the ebb of the riotous blast,
As the saw's mighty carriage goes thundering past,
One man at the lever and one at the dog,
The slaughter is bloodless and senseless the log,
Yet the anguish of death and the torment of hell
Are quivering there in the long, awful yell
That shrills above tumult of gearing and wheel
As the carriage roars down and the timber meets steel.

Scream! And a board is laid bear for a home.
Shriek! And a timber for mansion and dome,
For the walls of a palace, or toil's homely use,
Is reft from the flanks of the prostrate King Spruce,
And thus in the clamor of pulley and wheel,
In the plaint of the wood and the slash of the steel,
Is wrought the undoing of Maine's sturdy lords,
The martyrs that nature yields up to our swords.

The song is the knell of these strong that are slain,
The monarchs that people the woodlands of Maine,
And the fury that whirls by mechanical law,
With rioting teeth and insatiable maw,
Is the saw;
And this is the song of the saw.

—Holman F. Day, in Lewiston Journal

Referring to the old subject of the value of hardwood lumber cut in winter compared with that cut in summer, the American Lumberman says that, while some practical lumbermen do not believe it makes much difference in what part of the year it is manufactured, the general theory that when the tree is full of sap, fermentation and incipient decay are more likely to set in than at other times, finds acceptance and is reasonable. It also thinks that winter sawn lumber comes out whiter and of a more uniform color, while lumber sawn during the hot months, with alternating periods of heat and dampness, is likely to stain in a way likely to diminish its value for some purposes.

Chemically hardened railway sleepers—the idea of a Munich architect named Hasselman - are proving quite satisfactory on the Bavarian state railroads. The process, lasting about six hours, consists in a double baking of the wood and treatment with oil of vitrol and sulphate of iron, followed by placing in a bath of chloride of lime and milk of lime at a temperature of 100° to 125° C. and a pressure of about 2½ atmospheres. Tbe cost is about two cts. per tie. The first baking destroys the germs of fermentation and induces mechanical union of the preservatives with the fiber of the wood, aud the second imparts remarkable hardness and so changes the character of the wood that it remains dry even in damp places.

The Brockville Times defines the Canadian position thus happily:—

We don't want to retaliate,
But by jingo, if we do,
We've got the spruce,
We've got the pine,
And we've got the nickel too.

## WHAT CONSTITUTES A DEAL AND A BATTEN.

A case of much interest to lumber exporters was decided in London, Eng., recently. The proceedings were instituted by Messrs. Hine Brothers, of Maryport, as owners of the steamship Greta Holme, to recover the sum of £40 15s. 5d. from Messers (Ltd.), timber merchants, 79½ Gracechurch Street, E. C., for extra freight alleged to be due under a bill of lading dated October 30th, in respect of 65 standards of scantlings, strips and shorts wrongly shipped as deals on board the plaintiffs' steamship.

Mr. Batten, plaintiff's counsel, said that the defendants were shippers of a cargo of timber from Montreal by the plaintiff's vessel. The present proceedings were brought for damages for failing to load certain numbers of standards of deals as per a contract which was admitted between the parties. The contract, which was made in Montreal, was in the form of a letter dated May 21st. The letter was a promise by the shipowners to let space for 400 stds. of deals, Montreal to the Surrey Commercial Docks, and the price was 40s. It also stipulated that the deck portion was not to exceed 20 per cent. of the under-deck cargo. An agreed statement of the facts had been filed, but there would be some additional evidence, probably. According to the agreed statement of facts, of the 400 stds. of deals the defendants had alleged that 65 stds. were not deals, but battens. They were little pieces measuring 2 in. thick and 6 in. wide. The first question was this: Under the contract giving leave to the shippers to ship deals, were they at liberty to ship anything which was not known in the trade as a deal? The second question was, If not, what were the damages they must pay to the shipowners. In that case the freight was agreed at £2, but persons who had shipped smaller pieces than were contemplated were made to pay 12s. 6d. per std. more. That action was brought to recover the difference in the freight on £2 and £2 12s 6d. The reason was this: Small pieces of battens took up a great deal more room than the larger deals. Therefore one got a fewer amount of standards on which freight had to be paid in the same allotted space. There were witnesses who were conversant with the timber trade there in court to prove the reasonableness of their case. The bills of lading were signed by the master under protest and no doubt complaints were made. There were put on board 3,451 battens, measuring 21 stds., and which were 2 in. by 6 in., 4,584 measuring 23 stds., and which were 2 in. by 5 in.; 3,678 battens measuring 15 stds., 2 in. by 4 in.; 405 ends measuring one std. odd, 2 in. by 6 in.; 437 ends which were 2 in. by 5 in.; and 540 ends 2 in. by 4 in., about a standard each. The only questions between the parties were whether the plaintiffs were entitled to any, and if so, what amount of extra freight in respect of all or any of the pieces comprised in the 65 stds. beyond the freight already paid and the costs of the action. According to "Stevens on Stowage," a deal must be 7 in. broad. The law of Canada on the subject said: "The Quebec standard hundred of deals shall be 100 pcs. 12 ft. long, 11 in. broad, and 2½ in. thick. And deals of all other dimensions shall be computed according to the said standard; deals of all qualities shall not be less than 8 ft. long, 7 in. broad and 2½ in. thick; deal ends shall not be less than 6 ft. long, and shall be computed according to the Quebec standard." According to Webster's Dictionary, a deal could not be so described unless it was 7 in. broad. So they would have to start with the presumption in favour of the shipowners in that case.

Mr. Murray Kennedy, a member of the firm of Kennedy, McLean & Co., of Montreal, was called. He said they were shipbrokers, and he had had many years' experience as a shipbroker and in the timber trade in Great Britain, as well as at Montreal. The measurements given by the Surrey Commercial Dock Company applicable to that case had been before him. They were based, as was the plaintiff's case, on what was commercially known in the timber trade as "battens." They were not "deals." He was present in Montreal when the timber in question was shipped. At that time he protested to the shippers that they were shipping battens instead of deals. Other timber of the same dimensions was shipped on the Greta Holme on the same voyage. Messrs. Sharples, timber merchants, shipped a lot. The same complaint arose in reference to them, but Messrs. Sharples had paid the extra 12s 6d which the defendants were now resisting their liability for. The smaller wood took more space on the ship, and that accounted for the increased charge for freight. It would cost more to discharge, and took longer to handle. To use a phrase well known in the timber trade, it "blew the ship out." In cross-examination he said it was not true to say that the term "deals" was used in the trade to cover both deals and battens. His definition of a batten was that for shipping purposes it would be 2 in. to 3 in. thick, 10 ft. or so long, and 3 in. to 6 in. wide. Battens were not known to be 4 in. by 9 in. wide. Such a thing was certainly not known in the Canadian trade. A piece of wood 3 in. thick and 4 in. wide was a batten, and so it would be if it were 5 in. wide. They were not generally shipped 4 in. thick and 5 in. wide, but if they were he would call it a scantling. In the whole course of his experience of the timber trade he had never known of an action being brought to recover extra freight for carrying pieces of timber because they were 2 in. by 4 in., and not deals. Where the measurement was 2 in. by 5 in. or 6 in.—where they were battens—then an extra claim had been made.

Mr. Kennedy was cross-examined and other evidence taken, but decision was given as before stated, for the defendants.

The Timber Trades Journal gives the following definition of a deal: "A deal, roughly speaking, is understood to mean a piece of sawn wood over 6 to 8 feet long (8 feet are sometimes called deal ends), 9 and under 11 inches wide and 3 inches thick. Two-and-a-half inches thick by 9 inches wide would be called a deal, but 2 inches by 9 inches some would insist upon calling a board. Should 3 x 8 inches be termed a batten or a deal? and if a deal, how should 2½ x 8 inches be designated? These are not questions of vital importance, and that there should be any difference of opinion arises from the fact that of late years wood has been manufactured abroad into intermediate sizes other than the old-fashioned dimensions of 3 x 11, 3 x 9, 3 x 8, etc., and there is now a sort of border-land of dimensions which the most experienced may well hesitate to classify. But the true definition of a deal, according to the Petersburg standard, which forms the basis of all contracts made in this country, is 1½ x 11 inches wide and 12 feet long, or its equivalent in any dimensions. The distinction between deals and battens is regulated more by custom than anything else, and is quite apart from the cubical contents of the wood, the dividing line being drawn at 7 inches wide; all sawn wood above that width is reckoned as deals. The generally accepted definition of a batten is 2½ inches and 2 inches thick, and any width above 4 inches and not exceeding 7 inches, 3 x 3 and 3 x 2½ are usually termed scantlings, as well as 2 x 4, but the term batten would apply to them all. Taking into account the great diversity of sizes that now figure amongst the foreign imports, as well as from our American colonies, it will be safest to let the dividing line between deals and battens be drawn at 7 inches in width—if under 3 inches in thickness. This practically brings the 3 x 7 within the deal sizes, but it is the simplest way out of the difficulty."

## PROFIT IN GROWING TIMBER.

General Andrews, the Fire Warden and Deputy Forest Commissioner of the State of Minnesota, read at the last annual meeting of the Minnesota Forestry Association a paper prepared for him by Dr. C. A. Schenck, the Superintendent of Mr. Vanderbilt's forests at Biltmore, on the "Utilization of Waste Lands for Forest Purposes." There are now in Minnesota five million acres of public lands, two million acres of which are practically unavailable for agriculture, but are readily available for forestry. Supposing this land to be now bare, and to be planted by hand, cared for and guarded for eighty years, its value at the end of that period would be, under ordinary circumstances, nearly double the total cost, including taxes and compound interest at two per cent. If the land should already be partly wooded, so that it could seed itself, the original outlay would be much less, and if prices of lumber should be higher in eighty years than they are now, which is altogether probable, the profit would be proportionately greater; while Dr. Schenck allows nothing for profits from the sale of brush-wood, the lease of hunting and fishing privileges, and other incidental sources of income, which might, in the aggregate, form a considerable sum. Besides the direct profits, there would naturally be indirect gains through the conservation of streams and springs, all of which should count, and which would go far to make up for the charge for interest. Meanwhile, employment and comfortable homes would be provided for a large number of persons in and about the forests, and the cost of fire-wood and lumber would be lessened for all the inhabitants of the State, and the Commonwealth would possess, when its forests came to permanent productiveness, one of the best and safest investments known.

## "WANTED AND FOR SALE."

Persons having for sale or wishing to purchase a particular lot of lumber, a mill property, timber limits, second hand machinery, etc., in fact, anything pertaining to lumbering operations, will find a buyer or seller, as the case may be, by placing an advertisement in the "Wanted and For Sale Department" of the CANADA LUMBERMAN Weekly Edition. Testimonials to the value of this department by those who have given it a trial state that the results of advertisements were frequently better than anticipated. The cost is comparatively small. Mill owners might, with profit to themselves, make use of this method of advertising their stock to a still greater extent.

# CANADA LUMBERMAN

## WEEKLY EDITION

The Lumberman Monthly Edition, 20 pages } $1.00 PER YEAR { The Lumberman Weekly Edition, every Wednesday

*THIS PAPER REACHES REGULARLY THE PRINCIPAL LUMBER MANUFACTURERS AND DEALERS THROUGHOUT CANADA, AND WHOLESALE BUYERS IN GREAT BRITAIN, THE UNITED STATES AND OTHER FOREIGN MARKETS.*

VOL. V. TORONTO, ONT., JUNE 28, 1899 No. 23.

**CANADA LUMBERMAN**

PUBLISHED BY

**The G. H. Mortimer Publishing Co'y of Toronto, Limited**

*Confederation Life Building - TORONTO.*

Branch Office:
NEW YORK LIFE INSURANCE BUILDING,
MONTREAL.

**Weekly Lumberman,** published every Wednesday. Contains reliable and up-to-date market conditions and endencies in the principal manufacturing districts and leading domestic and foreign wholesale markets. A weekly medium of information and communication between Canadian timber and lumber manufacturers and exporters and the purchasers of timber products at home and abroad.

**Lumberman,** Monthly. A 20-page journal, discussing fully and impartially subjects pertinent to the lumber and wood-working industries. Contains interviews with prominent members of the trade, and character sketches and portraits of leading lumbermen. Its special articles on technical and mechanical subjects are especially valuable to saw mill and planing mill men and manufacturers of lumber products.

☞ Subscription price for the two editions for one year, $1.00.

## WANTED AND FOR SALE

Advertisements will be inserted in this department at the rate of 15 cents per line each insertion. When four or more consecutive insertions are ordered a discount of 25 per cent. will be allowed. This notice shows the width of the line and is set in Nonpareil type; 12 lines make one inch. Advertisements must be received not later than 4 o'clock p.m. on Tuesday to insure insertion in the current week's issue.

FOR SALE.

CEDAR, 8x10, 10x10, 12x12, from 10 to 24 feet long. Apply to W. A. PLAYFAIR, Playfair, Ont.

**PINE FOR SALE.**

45 M FT. GOOD PINE LUMBER, 12 and 14 ft. long, 2, 1½, 1¼ and 1 in. thick—sawn in May. At Baird's Mill, five miles from Markdale. J. RITCHIE, Glascott, Ont.

## SAW MILL MACHINERY FOR SALE

LARGE SAW AND SHINGLE MILL AT LONG Lake, capacity 30,000 ft., complete with first class machinery. Engine 22×26, 4 Boilers, Shafting, Belting, etc.

ALSO

VALUABLE SHINGLE AND PONY SAW MILL in the Village of Port Sydney, a Boarding House and 4 Lots adjoining. Excellent situation for buying Timber and Shipping. Must be sold at once.

THE UTTERSON CO., Limited.
Toronto, Ont.

## TO LUMBER DEALERS

THE NEWFOUNDLAND IRON ORE CO., Limited, of Workington, Newfoundland, invite tenders for the delivery at Old Perlican, Trinity Bay, Newfoundland, of a large quantity of

**12 AND 10 INCH SQUARE SPRUCE SAWN TIMBER**

Specifications may be obtained at the office of this paper.

The Company does not bind itself to accept the lowest or any tender.

S. HERBERT WILLIAMS,
Superintendent.

WANTED — Situation as Lumber Inspector, Shipper and Culler. D. SQUIRE, Hoath Head, Ont.

HAVE YOU ANY STOCK WHICH YOU WISH to sell? If so, make the fact known to probable buyers by placing an advertisement in this department. Address, CANADA LUMBERMAN, Toronto.

FOR SALE.

COMPLETE SAW MILL MACHINERY, PLANing, Sash and Door Machinery; modern and in good condition. Can be seen at Toronto. Apply PETER RYAN, Toronto.

FOR SALE.

ONE CARLOAD BASSWOOD, CUT ½-INCH thick, 5 to 7 feet long, 4 to 5 inches wide, dressed if desired to ⅜-inch thick. PATENT CLOTHBOARD COMPANY, Parry Sound, Ont.

SAW MILL MACHINERY FOR SALE.

THE COMPLETE MACHINERY OF A SAW Mill, consisting of a steam feed large carriage and frame, one rope feed ditto, double edger and trimmers, swing saws, automatic grinders, belts and saws in good order; all made by Watertous, Brantford. Will be sold cheap. Apply to J. K. WARD, Mona Mills, Montreal, Que.

**FOR SALE**

A FIRST-CLASS LUMBER AND SHINGLE Mill, average capacity per day 35 M. feet lumber, 70 M. shingles, and 15 M. lath; situated in Huntsville, close to the G. T. R. station, with sidings to mill; plenty of virgin pine. Also a first-class site for a tannery, plenty of tan bark. Will be sold at a bargain. Apply to T. WHALEY, Huntsville, Ont.

### CURRENT TRADE CONDITIONS.

ONTARIO.

Reports from lumbermen are again but a repetition of what has already been said regarding the almost unprecedented strength of the market. Everywhere buyers are found in search of stock, and their eagerness to purchase is causing prices of all grades to stiffen. Dealers from Michigan have visited Georgian Bay mills, and are reported to have contracted for some lots of lumber at figures which will leave a fair margin of profit to the manufacturers, even in the face of the two dollar duty; in fact, the buyer invariably pays the duty. A feature favorable to the Ontario lumber industry is the number of foreign importers who have this year personally visited the mills in this province for the purpose of satisfying themselves as to what quantity of lumber they could advantageously import from Canada. Last week Mr. L. R. Babbitt, representing Babbitt Brothers, wholesale merchants, of Buenos Ayres, visited the Ottawa mills for this purpose. While the trade may not realize any immediate results from these visits, it augurs well for the future of Canadian lumber. The above remarks, although applying more particularly to pine, also indicate the condition of the hardwood market. Buyers are numerous and stocks scarce—it is a sellers' market. Generally hardwoods are firm, maple being the only lumber which shows any weakness, and that is not such as to cause alarm.

QUEBEC AND NEW BRUNSWICK.

The local demand for lumber in Quebec is improving, building material representing a consiserable volume of stock. Many of the mills have orders in excess of their output, and all are running full time. Spruce log run is selling at from $8 to $12 f. o. b. cars at mill, and birch at $12 to $15. The Quebec merchants are busy shipping lumber and timber to foreign countries, and a number of vessels have been chartered for July loading.

In Quebec and New Brunswick the industry is in a healthier state than for years past, although high freight rates have interfered with shipments to some extent. The logs have been coming along slowly, and some of the mills have been compelled to close down uutil their drives were received. It is stated that not over 90,000,000 superficial feet of logs will pass through the Fredericton booms this season, as compared with 131,000,000 feet last year and 165,000,000 feet in 1897. St. John deals are worth about $11 per thousand, which is from $2.50 to $3 higher than the prices one year ago. There are no Bay of Fundy deals offering, as they have all been bought up. The prospect is that lumber will be scarce and prices higher as the season advances.

UNITED STATES.

As yet there are no evidences of a midsummer lull in the lumber trade of the United States; on the other hand, dealers and manufacturers alike report an increased number of orders for nearly all kinds of stock. Buyers have been very numerous at northern producing points, and it is predicted that by the end of August practically the entire seaon's cut of the mills at Ashland, Duluth, Menominee and other lake ports will have been sold. Prices are steady and buoyant, with an upward tendency, and some predict that there will be a further advance in the near future. Competition in buying is very keen, as the brisk demand since the spring opened has prevented wholesalers from accumulating their usual quantity of stock. At Ashland, Wis., it is expected that all widths of No. 2 stock will advance, as the difference at present between No. 2 and No. 3 is but $1 per thousand. As showing the position of the market, the Ashland Lumber Co. recently made a sale of 250,000 feet of Norway edge boards at $8 a thousand, while the price paid for similar stock last year was $4.75. An effort has been made to even up Buffalo and Tonawanda prices of pine. The price of uppers is now $51 for inch and $65 for four inch, $45 for inch selects, $38 for inch fine common, $30 for No. 1 cuts, $20 for No. 1 barn, $14 for No. 1 box and $12 for mill culls. Spruce lumber is gradually becoming a a more important factor in the Buffalo market. The Loud Company is preparing to send down quite an amount of spruce to the Black Rock yards from Munising, Mich. Generally spruce is improving, although some sizes still show signs of weakness.

The demand for hardwood lumber continues unabated, although the situation has been relieved in a slight degree by the movement of the new cut. It is expected that there will be a decline in prices for oak, ash and other woods that have been particularly scarce, but the generally accepted opinion is that hardwood values will remain firm during the balance of the season.

FOREIGN.

Speaking generally, the foreign markets are in a fairly prosperous condition. Stocks on hand are not too heavy, and there is little probability that the arrivals will be greater than will be consumed by the various manufacturing industries. In Great Britain the wood trade is undergoing a period of buoyancy almost without parallel in its past history. The opinion is freely expressed that exports from Sweden this year will be less than in 1898, while it is certain that the Canadian exports will not overburden the market. This points to a higher level of f.o.b. values than at present rule, and removes almost any probability of prices depreciating. British importers, however, express some dissatisfaction with the Canadian trade, owing to the custom adopted by some shippers of sending goods forward on consignment, these goods being subsequently sold at lower prices than paid originally by the direct importers, and creating an unfair competition, with a lowering tendency on values. At London a slightly firmer tone is apparent for 2½-inch battens; 2½×7 Quebec spruce has been tried, but the trade has not responded as expected, though in the north it is learned that the experiment has met with some success. In the hardwood market the situation has not changed, the demand continuing steady.

### STOCKS AND PRICES.

Goodwillie & Page, of Fonthill, Ont., recently shipped eight cars of chestnut and oak lumber.

Scatcherd & Son, of Buffalo, are said to have two men in Canada buying hardwoods, mostly soft elm.

The United Lumberman cleared last week from Playfair's dock at Midland for Tonawanda with a large cargo of lumber.

The attention of lumber manufacturers is directed to the advertisement of Messrs. Irvin & Sellers, on page 3, asking for maple squares.

The log cut on the Restigouche river in New Brunswick last winter was 29,000,000 feet. Only a small quantity of logs will be hung up.

McCormick Bros., of Saginaw, Mich., who deal extensively in hardwoods, report an active demand for elm and ash. There is plenty of maple and less call for it than for the other woods.

The A. P. Bliss Lumber Co., of Saginaw, is now towing logs from Parry Sound to Saginaw. These logs were cut by the Conger Lumber Co. in the season of 1897-98 and left in the woods.

On Wednesday, June 21, Alex. Fraser's raft of square timber from the Coulonge was towed to the head of the Calumet slides. This is the second raft to pass down the slides this season.

At Saginaw, Mich., log run is quoted at $18 to $24, and is scarce at these figures. There is a continued good demand for box lumber at $13, and for Norway at $10 to $12 for ordinary lengths.

Cedar shingles continue to be scarce in the Eastern States, and the manufacturers

are sold far ahead. Stocks of everything in the cedar line are exceedingly scarce, shipments being made about as rapidly as the stuff can be gotten out.

Geo. Rowlings, of Musquodoboit, has the contract for furnishing lumber to the Furness Withy Co. for the construction of their new wharf at Halifax. Three vessels are now engaged transporting the lumber to that city.

H. J. Crowe, of Bridgetown, N.S., has chartered a ship to load deals at Annapolis, N.S., for the United Kingdom. This will be the first shipment of the kind from that place. The bark Argentina is now loading lumber at Bridgewater, N.S., for South America.

Following is a comparative statement of timber, etc., measured and culled at Quebec to June 27th, as furnished by the Supervisor of Cullers :

| | 1897. | 1898. | 1899. |
|---|---|---|---|
| Waney white pine, cu. feet.. | 814,874 | 670,881 | 869,767 |
| White pine, cu. feet..... | 81,391 | 435,315 | 263,971 |
| Red pine, cu. feet..... | 56,630 | 77,456 | 87,429 |
| Oak, cu. feet..... | 593,172 | 479,220 | 288,683 |
| Elm, cu. feet..... | 262,723 | 260,262 | 313,925 |
| Ash, cu. feet..... | 68,786 | 22,234 | 42,790 |
| Basswood, cu. feet ..... | 15 | | |
| Butternut, cu. feet ..... | 293 | 795 | 60 |
| Birch and Maple, cu. feet... | 149,917 | 106,480 | 229,867 |

A raft containing over 3,000,000 feet of logs, consigned to the Saginaw Lumber & Salt Co., arrived at Saginaw on the 17th inst. This company has four more rafts to take over from the Georgian Bay, the logs being cut from Indian reservation lands. It is estimated by the American Lumberman that nearly 100,000,000 feet of logs which were gotten out in the Georgian Bay district for the Michigan market are being held in storage booms, in the expectation that some arrangements will be affected whereby they can be taken to Michigan.

The Board of Trade returns show that the imports of wood goods into Great Britain for the month of May of this year were considerably more than in the corresponding months of 1898, both in sawn and hewn wood, the increase amounting to 77,202 loads of hewn and 38,444 loads of sawn. The excess in sawn goods is chiefly the result of increased spruce shipments to the west coast of England and the arrival of cargoes from Riga, Windau, and other Russian ports. For the five months of this year, the imports also show an increase as compared with last year. Of timber there were imported up to the end of May last 1,788,280 loads, against 1,571,120 loads in 1898.

### THE BARBADOS MARKET.

Of the Barbados market, Messrs. Clairmonte, Man & Co. say :

LUMBER.—Since last advices, there have been no arrivals with lumber. White pine is in moderate supply ; last sale was the cargo ex Grace Rice, arrived on May 12th, at $21.50 for first and $15.50 for second quality. The spruce demand continues good, last saie $15 for first quality.

SHINGLES.—The market for long Gaspe cedar has sharply declined ; last sales ex Duart Castle, at $3.50 per M ; no recent import of laying shingles ; cypress, sales ex store $8.50 6-in. heart, saps $6.50. June 3rd: s.s. Duart Castle, from St. John, N.B., 388 M long Gaspe cedar shingles, $3.50 ; 23 M do. 6-in, $6.61 ; 5 M do. 5-in., $5.61 ; 3 M do. 4-in., $4.61 ; 1½ M do. 3-in., $3.61.

### SHIPPING MATTERS.

From St. John, N. B., it is learned that the following charters have been arranged: Str. Berax, Pugwash, N. S., to United Kingdom, deals, 44s; str. Dora, Cape Tormentine, N. B., to Manchester, deals 43s 9d ; Lettura, St. John, N. B., to w.c. England, deals, 43s 6d.

The Timber Trades Journal reports that there has been a large amount of tonnage chartered from Canada at increased rates, showing an advance of about 2s 6d for July. The fixtures include the following: Three Rivers to Hull, 1200 stds., 46s 3d ; Saguenay, St. Thomas or Batiscan to London, 1200 stds., 45s. June, 1400 stds., 44s, July ; Montreal to Hull, 1000 stds., deals, option half boards, 47s 6d, August ; Quebec or Montreal to w.c. England, 1100 stds, 46s 3d, June ; St. John, N. B., to Liverpool, Manchester or Barrow, 1600 stds, 45s, July and August ; West Bay to Manchester, 1200 stds, 46s 3d, July ; Miramiechi to Manchester, 1200 stds, 46s 6d, 1450 stds, 47s 6d, 1350 stds, 46s 6d, all July ; Miramiechi to e.c. Great Britian, 50s.

### BRITISH VIEW OF THE CANADIAN TRADE.

The Timber Trades Journal, of London, Eng., comments as follows regarding the Canadian pine and spruce trade:

THE PINE MARKET.—The London market for pine deals is, we regret to say, not any better than it was a year ago. We are told that large parcels have been sold overside ex ship, but we are also informed that these sales have been at such nominal profits that the business might just as well have been let alone. It is evident, if our information is correct, that pine business is by no means satisfactory. Old hands in the pine trade are gradually dropping out because there is nothing to be made in it, but there are always new men with less experience coming forward willing to step into the breach in the hope of finding the way to a more remunerative system, but they will be reckoning on a very insecure foundation in building their hopes of profit on an all round substantial improvement, without which it is impossible to make the pine business pay. Until there is a better system of cutting and selling in Canada, and less oddments consigned to this market, it will be impossible to make a remunerative one to the importer here. All the experienced firms in this trade are unanimous in the opinion that a reformation must be made if the pine business is to remain on its hitherto extensive scale, otherwise it will descend into a hand-to-mouth business, and the large importers of former times will seek other and more fertile fields for the outlay of their capital.

THE SPRUCE TRADE.—Regarding spruce, we hear that there is a strong demand round the coast, but we are sorry to say we cannot hear the same accounts of London. Prices, notwithstanding the talk about improvements, are not a whit better than last year, although shippers state they are getting more. On the Continent we have reason to believe the demand is still good, and that the sales reported last month have been supplemented by others at some small advance, but this in no way affects the demand on this side where the supply always exceeds the wants of the trade. We wish we could confirm the reports of improvements so long expected, but it is a well-known fact that the bulk of the spruce shipped to this market is used in the manufacture of boxes or packing cases, which, after service, are of comparatively little value. Therefore, there never can be a proportionate rise in spruce prices that appertains to other wood goods that become entirely absorbed in consumption.

### SALE OF CANADIAN WOOD GOODS.

Following is the result of a sale of wood goods held by Churchill & Sim, London, Eng., on Wednesday, June 14th :

PINE.—Ex Merriac, from Montreal—11 ft. 3 x 11 in. first quality (Gilmour's 1897 cut), £19 ; 19 ft. 3 x 11, £18 15s. Ex Emma, from Montreal—6-8 ft. 3 x 11 in. first quality (Hawkesbury cut), £18. Ex Cervona, from Quebec—9 ft. 3 x 11 first quality, £18. Ex Milwaukee, from Quebec—3 ft. 3 x 11 in. first quality, £11 ; 3 ft. 3 x 7-9, £9 5s.

SPRUCE.—Ex Turania, from Quebec—13 ft. 3 x 9 in. second quality, £8 and £7 15s. Ex Fremona, from Montreal—13 ft. 3 x 9 in. second quality, £7 15s. Ex Cameo, from Quebec—12 ft. 2½ in. unassorted, £7 ; 11-12 ft. 2½ x 7, £7 5s ; 12-13 ft. 3 x 10 fourth quality, £6 15s. Ex Eviline, from Quebec—9-16 ft. 2 x 10-11 unassorted, £7.

### LARGE PURCHASE OF TIMBER LIMITS.

It is reported that a large transaction in timber limits has just been negotiated, an American syndicate having purchased timber limits in the province of Quebec to the value of $1,850,000. It is stated that the purchasers represent the pulp trust formed in the United States. Mr. Chas. Lionais, mining engineer, of Montreal, negotiated the deal. The limits are situated on the north shore of the St. Lawrence and in the peninsula of Gaspe. The American company has a capital of $10,000,000, and will erect at once two pulp mills, to cost $1,000,000 each, and to have a capacity of 600 tons per day. A party of engineers is said to be now engaged in making the necessary surveys.

The shingle mill of the Cambridge Lumber Co., at McDonnell's Siding, three miles west of South Indian, Ont., was burned recently, at a loss of $3,000. It is the intention to rebuild, as the company owns a considerable limit of pine in the immediate vicinity suitable for the manufacture of shingles.

### LUMBERMEN'S INSPECTION BOOK.

Send four 3-cent Canadian postage stamps for a copy of the LUMBERMAN'S VEST-POCKET INSPECTION BOOK, containing rules for the inspection of Pine and Hardwood Lumber in the leading markets of Canada and the United States.

The shingle mill of Duff Bros., in Beckwith township, was destroyed by fire last week, together with machinery and some timber and shingles.

### LUMBER FREIGHT RATES.

CANADA ATLANTIC RAILWAY.

Lumber freight rates on the Canada Atlantic Railway, according to the summer schedule effective April 1st, are as follows: Ottawa, Rockland, Hawkesbury and intermediate points to Toronto, 10 cents per 100 lbs.; Parry Sound to Toronto, pine 10 cents, hardwood, 11 cents ; Ottawa to Oswego, $1.90 per M ft. ; Ottawa to Syracuse, $2.20 per M ft , (3,000 lbs. and under per M ft.); Ottawa to Montreal, $1.00 per M feet, lath 20 cents per M pieces ; Quebec, $2.00 per M feet, lath 40 cents per M pieces ; Arnprior to Montreal, $1.50 per M feet, lath 30 cents per M pieces ; Quebec, 12 cts. ; Pembroke to Montreal, $1.75 per M ft., lath 35 cents per M pieces; Quebec, $2 75 per M ft., lath 55 cents per M pieces ; Ottawa to New York, $2.50 per M ft., lath 50 cents per M pieces ; Arnprior to New York, $3.00 per M ft , lath 60 cents per M pieces ; Pembroke to New York, $3.25 per M ft., lath 65 cents per M pieces ; Parry Sound, track, $3.50 per M ft., lath 70 cents per M pieces ; Ottawa to Buffalo, 12 cents per 100 lbs.; Ottawa to Port Huron and Detroit, 14 cents per 100 lbs.; Ottawa, Rockland and Hawkesbury to Boston and common points, local 15c.; exports 11c. per 100 lbs.; Arnprior to Boston and common points, local 17 cents, export 15 cts. per 100 lbs.; Parry Sound to Boston and Portland and common points, local 21½ cents, export 20 cts. per 100 lbs.; Ottawa, Rockland and Hawkesbury to Portland, &c., 15 cts.; Arnprior to Portland, 17 cts.; Ottawa to Burlington, 6c. per 100 lbs.; Ottawa to Albany, 10 cts. per 100 lbs.; Arnprior to Albany, 12 cts. per 100 lbs.; Parry Sound to Albany 17 cts. per 100 lbs.; Ottawa to Scranton and Wilkesbarre, Pa., also Binghampton, N.Y., 13 cents per 100 lbs, from Arnprior 15 cents, from Parry Sound 20 cents per 100 lbs.; Ottawa to St. John, N.B. and common points, 20 cents per 100 lbs.; Ottawa to Halifax, N.S., and common points, 21 cents per 100 lbs. Minimum carload weight for shipment of lumber, lath, shingles, etc., is 30,000 lbs., and rates quoted above are in cents per 100 lbs., except when quoted per M ft.; minimum carloads 10 M ft., lumber not exceeding 3,000 lbs. per M ft.; lath 50,000 rates pieces, not exceeding 600 lbs. per M pcs. Ottawa apply on shipments from Rockland and Hawkesbury.

GRAND TRUNK RAILWAY.

The freight tariff on lumber issued by the Grand Trunk Railway Company, effective June 1st, 1899, contains the following general instructions: Minimum weight 30,000 lbs. per car, unless the marked capacity of the car be less, in which case the marked capacity (but not less than 24,000 lbs.) will be the minimum weight. Exceptions—Cedar posts in box cars, dry basswood and light pine or cedar lumber, dry cedar shingles, charcoal and sawdust, which cannot be loaded up to 30,000 lbs. or up to the marked capacity of car, will be carried at actual weight, minimum 24,000 lbs. The rates on lumber in the tariff will not be higher from an intermediate point on the straight run than from the first named point beyond to the same destination.

Excepting to Toronto and Hamilton, the rates on hardwood are the same as on pine. To these two points the rate on hardwood is one-half cent higher than on pine.

From Glencairn, Creemore, Aurora, Barrie, Collingwood, Penetang, Coldwater, Waubaushene, Sturgeon Bay, Victoria Harbor, Midland, Fenelon Falls, Longford, Gravenhurst and other points in groups B and C, to Toronto or Hamilton, 7c. on pine and 7½c. on hardwood ; Bracebridge to Toronto or Hamilton, 7½c. pine and 8c. hardwood ; Utterson, Huntsville, Navor, Emsdale, Katrine to Toronto or Hamilton, 8c. pine, 8½c. hardwood ; Burk's Falls, Berriedale Sundridge and South River, to Toronto or Hamilton, 8½c. pine, 9c. hardwood ; Trout Creek, Powassen and Callender to Toronto or Hamilton, 9½c. pine, 10c. hardwood ; Nipissing Junction and North Bay, 10½c. pine, 11c. hardwood. Rate from Goderich, Kincardine, Owen Sound and Wiarton to Toronto or Hamilton, 7c. pine, 7½c. hardwood. These rates are per 100 lbs. Rates from Toronto east to Belleville are 8c. per 100 lbs. The maximum rate from any point north or west to Montreal is 16½c. per 100 lbs. For rates on railway ties, tie timber, cedar lumber or posts, mahogany, rosewood, walnut, cherry, and other valuable woods, application must be made to the district freight agent.

CANADIAN PACIFIC RAILWAY.

To Toronto and Hamilton—from Klock, Mattawa, Bonfield, North Bay, Sturgeon Falls, Cache Bay and Warren, 9 cents ; from Sudbury Jct., Rayside and Chelmsford, 10 cents ; from Cartier and Geneva Lake, 10½ cents; from Spanish Forks, Biscotasing, Massey, Cutler. Spragge and Algoma, 12 cents ; from Dean Lake, Thessalon, Desbarats, and Isbester, 14 cents per 100 lbs. on pine and soft woods, the rate on hardwoods being one cent per 100 lbs. higher ; from Ottawa, Hull, Aylmer and Dechenes Mills, Arnprior, Braeside and Pembroke, to Toronto, the rate is 10 cents both on pine and hardwood.

To Albany and points taking Albany rates—from Ottawa, Hull, Aylmer and Deschenes Mills, 10 cents ; East Templeton, Buckingham, Calumet and Carleton Jct., 11 cents ; Arnprior, Braeside and Renfrew, 12 cents ; Pembroke and Eganville, 13 cents per 100 lbs. These rates are based on a minimum of 30,000 lbs. per car.

To New York, for track delivery and all points on the Hudson river, or the New York Central and West Shore railways from Ottawa, Hull, Aylmer, Deschenes Mills, 15c. per 100 lbs.; from Carleton Junction, 16c.; from Arnprior, Braeside and Renfrew, 17c.; from Eganville and Pembroke, 18c. The rates to New York, including lighterage within the free lighterage limits of New York harbor, are 2 cents per 100 lbs. additional.

To New York via barge line from Albany—from

LAWRENCE & WIGGIN
Importers and Manufacturers BOSTON, MASS.

Aylmer, Buckingham, Deschenes Mills, East Templeton, Hull and Ottawa, pine and shorts in lots of 50 M feet and upwards, $2.50 per M feet, under 50 M feet $3.25; lath in lots of 250 M feet and upwards, 50 cents per M pieces, under 50 M pieces, 60 cents; hardwood in lots of 50 M feet and upwards, $4 per M feet, under 50 M feet, $4.25; from Carleton Jct., 25 cents per M feet lumber and 5 cents per M pcs. lath higher than Ottawa rates; from Arnprior and Braeside, 50 cents and 10 cents higher; from Renfrew, Eganville and Pembroke, 75 cents and 15 cents higher. Lumber and lath not to exceed 3,000 lbs. per thousand feet pine, 4,000 lbs per thousand feet hardwood lumber, or 600 lbs. per thousand pieces lath. Above rates include lighterage within regular lighterage limits in New York harbor, in lots of lumber 50 M feet and over, and lath 250 M pcs. and over; under that amount subject to extra towage. Seasoned pine shorts under 5 feet in length will be charged 50 cents per M feet over rates named on seasoned pine lumber.

To Cape Vincent, Clayton, Fulton and Oswego, N. Y.—from Ottawa, Hull and Carleton Jct., softwood $1.90 per M feet, lath 38 cents per M pcs., shingles 19 cents per M, hardwood 9½ cents per 100 lbs.; from East Templeton, Aylmer and Deschenes Mills, softwood $2, lath 40 cents, shingles 20 cents, hardwood 10 cents; from Arnprior, Buckingham and Braeside, softwood $2.05, lath 41 cents, shingles 20½ cents, hardwood 10½ cents; from Renfrew, Eganville and Pembroke, softwood $2.30, lath 46 cents, shingles 23 cents, hardwood 11½ cents.

To Charlotte, Rochester, Rome and Utica, N.Y.—from Ottawa, Hull, and Carleton Jct., softwood $2.20 per M feet, lath 44 cents per M pcs., shingles 22 cents per M, hardwood 10½ cents per 100 lbs; from East Templeton, Aylmer and Deschenes Mills, softwood $2.30, lath 46 cents, shingles 23 cents, hardwood 11 cents; from Buckingham, Arnprior and Braeside, softwood $2.35, lath 47 cents, shingles 23½ cents, hardwood 11½ cents. From Renfrew, Eganville and Pembroke, softwood $2.60 per M feet, lath 52 cents per M pieces, shingles 26 cents per M, hardwood 12½ cents per 100 lbs. To Sacketts Harbour and Syracuse, N.Y., rates on softwood, lath and shingles are same as to Charlotte, and rates on hardwood same as to Cape Vincent. Hardwood lumber rates will also apply on shipments of box shooks, bolts, chair stock (rough), clapboards, hoops, hoop and hop poles, lath, last blocks, posts and rails, shingles, staves and heading, wood pulp, pulpwood, timber and wood ashes.

MINIMUMS: Softwood lumber carloads, 10,000 feet; lath carloads, 50,000 pieces; shingle carloads, 100,000 shingles; hardwood lumber carloads, 30,000 lbs.

Summer rates effective April 1st are: To Montreal and points taking same rates—from Ottawa, Hull, Aylmer, Deschenes Mills, East Templeton and Buckingham, softwood $1.00 per M feet, lath 20 cents per M pieces, hardwood or dimension timber 4 cents per 100 lbs.; to Quebec and Three Rivers—from Ottawa, Hull, Aylmer and Deschenes Mills, softwood $2.00, lath 40 cents, and hardwood and dimension timber 8 cents: from Carleton Jct., softwood 15 cents, lath 5 cents, and hardwood and dimension timber 1 cent higher than Ottawa rates; from Arnprior and Braeside, softwood 50 cents, lath 10 cents, and hardwood and dimension timber 2 cents higher; from Renfrew, Eganville and Pembroke, softwood 75 cents, lath 15 cents, and hardwood and dimension timber 3 cents higher. Dimension timber rates will apply on lumber over 3 inches thick and over 16 feet in length.

To Boston and points taking Boston rates for local delivery—from Aylmer, Deschenes Mills, Ottawa Hull and points east thereof in Ottawa Valley 15 cents, Carleton Junction 16 cents, Arnprior, Braeside and Renfrew 17 cents, Pembroke and Eganville 18 cents per 100 lbs. To Boston, Mystic Wharf, East Boston, Mass., and Portland, Me., for export—from Ottawa, Hull and Buckingham 11 cents, Aylmer and Deschenes 12 cents, Arnprior and Braeside 13 cents per 100 lbs. Rates for export will ex Nov. 30th, 1899, unless sooner cancelled.

To Buffalo, Black Rock and Suspension Bridge, N. Y.—from Ottawa, Hull and Aylmer 12 cents, Carleton Junction 13 cents, Arnprior and Braeside 14 cents, Pembroke and Eganville 15 cents per 100 lbs

To Detroit, Mich.—from Ottawa, Hull, Aylmer and Deschenes Mills 14 cents, Buckingham 15 cents per 100 lbs

# THE NEWS.

—John McCrae expects to dispose of his sawmill in Gosfield South, Ont.

—Mr. Wm. Mitchell has just completed a new saw mill at Tweed, Ont.

—P. Gennelle & Co., of Nakusp, B.C., are opening a lumber yard at Rossland.

—Mr. John Kalbfieisch, of Tavistock, Ont., is shipping large quantities of butter boxes.

—Mr. A. D. Callin has sold his lumber business at Russell, Man., to Mr. James McKay.

—Chew Bros., of Midland, Ont., are having an electric light plant installed in their mill.

—Mr. Cowan, of Brandon, has purchased from Mr. Keith a saw mill at Prince Albert, N. W. T.

—Mr. McLean, of Bryson, Que., is about to commence the erection of a sawmill at Fort Coulogne.

—The Firstbrook Box Company, Limited, of Toronto, has been incorporated as successors to Firstbrook Bros. The capital stock is $300,000.

—The Keewatin Lumber Co., of Keewatin, Ont., have found it necessary to put on a night shift, and have therefore equipped their mill and yard with electric light.

—The Signal Towing & Rafting Co., of Wiarton, Ont., has been incorporated, with a capital of $3,000. Messrs. Robert Watt and A. A. Mackenzie are interested.

—A new sawdust slide has been erected at J. R. Booth's mill at Ottawa. The affair is 200 feet long, two feet wide and provided with the latest steel machinery to carry the sawdust.

—The shingle mill at Maxwell, Ont., owned by Mr. J. Hickling, was struck by lighting on May 30th and badly damaged. Two horses in the mill at the time were killed.

—Mr. H. L. Elliott has formed a partnership with Wm. Armstrong, to engage in the retail lumber business at Portage la Prairie, Man. The firm will be known as Wm. Armstrong & Co.

—A six hundred pound shaft attached to the driving wheel of one of the large engines in Gilmour & Hughson's saw mill at Hull, Que., flew to pieces recently. Luckily, no person was injured.

—It is claimed that the mills of the Columbia River Lumber Company at Golden, Beaver and Kault, in British Columbia, will have a larger output this season than any other lumbering concern in British Columbia.

—It is reported that a new company has made arrangements to build the Lindsay, Bobcaygeon and Pontypool Railway. This road, already subsidized by the Dominion Government, will open up a rich lumber country.

—The Imperial and Canadian Governments have agreed to each pay Messrs. Pickford & Black $60,000 a year for a fortnightly steamship service between St. John, Halifax and the West Indies, beginning next year.

—The residents of the municipality of St. Josephs, in Algoma district, are negotiating with Mr. Peter Chesterfield for the erection of a steam power saw mill and a sash and door factory, the whole to cost not less than $10,000.

—Incorporation has been granted to the Windsor Bent Goods Company, of Windsor, Ont., to manufacture bent goods, hubs, spokes, lumber, etc. James Samson, E. S. Spashett and J. E. O'Connor are provisional directors.

—As a result of the recent fire at Dawson City, the White Pass Railway and Canadian Development Company's route recently carried half a million feet of lumber and a quarter of a million shingles from Victoria to the Klondike capital.

—Messrs. Le Maine, Neilson & Co., 135 St. Peter street, Quebec, announce that they are acting as selling and purchasing agents for timber and pulp wood lands in the Dominion. They will also explore timber limits and report as to their value.

—Messrs. Knight Bros., of Burks Falls, Ont., are reported to have purchased the old saw mill and water power site on the east side of the dam from Mr. J. T. Harvie and the Dominion Bank. It is understood to be their intention to erect a saw mill on the property.

—The mill of A. & P. White, at Pembroke, Ont., commenced operations recently, after having been thoroughly overhauled. The principal improvements include new carriers, live rolls, trimmers and edgers, and two new boilers. The capacity is now about 40,000 feet per day.

—Mr. J. J. Whaley, late of the Whaley Lumber Co., Huntsville, Ont., has formed a partnership with Messrs. Passmore & Cobourn, of Guelph, to carry on a wholesale lumber business. Attention will be given to both local and export trade, and it is hoped to cultivate an extensive business with Great Britain.

One of the features of the coming Industrial Fair in Winnipeg will be a special exhibit of minerals, fruit, etc., from British Columbia. For this purpose special buildings will be erected, the lumber for which will be donated by the British Columbia lumbermen. The C.P.R. have offered to carry the lumber and exhibits free of charge.

—Mr. H. G. Ross and W. S. Hurst announce that they have opened an office at 515 Hastings street, Vancouver, B. C., for the adjustment of losses by fire, to be known as the Adjustment Agency of British Columbia. Mr. Hurst has been a building contractor, valuator and appraiser for thirty-four years, while Mr. M. Ross is a practical book-keeper and accountant, and is well known by many lumbermen of the western province.

—The Calhoun Lumber Co., of Calhoun, N.B., has been formed, with a capital stock of $40,000, to acquire mill properties, mill sites, water powers, etc., and to conduct general lumbering operations. The charter members are: Josiah Wood and Herbert M. Wood, of Sackville, N B.; Thomas B. Calhoun, of Calhoun, N.B.; John C. Calhoun, Albert, N.B.; and Mariner G. Teed, Dorchester, N.B.

—Mr. J. R. Booth has again shown his interest in his employees by arranging with the Canadian Railway Accident Insurance Company to introduce the employee collective system of accident insurance, which gives the men the advantage of paying the dues fortnightly without cost of collection. This policy has been adopted by the employees of the Eddy Company at Hull and McLachlan Bros. at Arnprior, and is said to have been found very satisfactory.

—The value of certain timber cut on lots 32 and 33, in the township of Oneam, Ottawa county, has been the subject of litigation in the Superior Court at Hull, Que. Mr. A. Proulx, owner of the timber, placed the value at $800, whereas the defendant, Mr. Chas. Logue, contended that the timber was entirely worthless, and would not have been cut by him only that he happened to be carrying on lumbering operations in the immediate vicinity of the lots in question. It was claimed that money was lost in taking the timber out, owing to the long haul.

—A question of no little interest to lumber manufacturers and shippers was raised in the case of Berube vs. the Hull Lumber Co., heard in the Hull Superior Court. It was as to whether raised projections on the sides of lumber rollers would be serviceable in lessening the possibility of accidents to men working on the rollers. Mr. McDougall, Q. C., for the company, endeavored to prove that the projections mentioned would be impractical and altogether useless. Mr. Major, counsel for plaintiff, undertook to uphold his contentions by having a lumber slide and a stock of lumber in the court room.

## CASUALTIES.

—John Allen, of Salem, became entangled in a belt in McClure's mill near Truro, N. S., and was drawn into the machinery and instantly killed.

—Word has been received of the drowning at the Cascades, on the Schyan river, of Eauchere Ladroulet, who was working on J. R. Booth's drive. He was a native of Westmeath, Ont.

—While M. W. H. Fowlds, proprietor of a sawmill at Hastings, Ont., was putting a board through the edging saw, a knot flew out, striking him in the right eye and injuring the ball.

## PERSONAL.

Hon. J. H. Ward and family, of Montreal, will again occupy their seaside residence at St. Patrick this season.

Mr. Isaac Cockburn, of Winnipeg, has been appointed secretary of the Western Retail Lumbermen's Association, as successor to Mr. John Dick.

Mr. Alexander Ferguson, of the firm of Kernahan, Webster & Ferguson, lumber merchants, London, Ont., died on May 31st, at the age of forty-one years. Deceased was an able business man.

Mr. Amos Laurence, one of the lumber kings of Cumberland county, Nova Scotia, died at his home at Southampton last month. He was head of the firm of Amos Laurence & Sons, and was engaged for many years in lumbering operations.

Among the saloon passengers by Elder Dempster & Co's. magnificient S.S. Mount Royal, which sailed for London on June 6th, was Mr. William A. Goodday, younger son of Mr. H. G. Goodday, of Quebec. He has entered the office of the well known London brokers, Messrs. Foy, Morgan & Co.

## TRADE NOTES.

The Stuart & A. R. Williams Machinery Company, of Winnipeg, Man., has been incorporated, with a capital of $490,000, to manufacture mill machinery, boilers and engines.

The Robb Engineering Company, of Amherst, N. S., have just sold, through their British Columbia representative, to the Brunette Saw Mill Company, a boiler for their steamer Vulcan.

Messrs. Long & Thompson, of Orillia, Ont., who manufacture an improved shingle machine, have just increased their plant by a 50 inch gap lathe, manufactured by John Bertram & Sons, of Dundas, Ont., and weighing 10 tons.

The business of Mr. Madison Willians, Port Perry, Ont., has been transferred into a joint stock company, to be known as the Madison Williams Turbine Company. The maunfacture of turbine water wheels, saw mill and other machinery will be continued.

## SHUTTING OFF STEAM.

"Shall we stop our advestising for a while now?"

This is a question that some business men are apt to ask themselves, particularly in the summer, or during what they regard as their "dull season."

Suppose your engineer asked you:

"Shall I stop putting coal on my fires, sir?'

What would you reply?

"Why no—unless you want the engines to stop."

The advertiser who thinks of discontinuing may argue, "We have been advertising so long and so steadily that our name and specialities are well known, and we intend to advertise again when business is better in our line than it appears to be now; in the meantime our business won't stop."

No; neither will the engine stop the minute the men suspend shovelling in the coal. The point is, however, that when the engine is to be started again, ten times as much will have been lost in power as has been saved in fuel or feed.

Using up reserve force never pays.

It is a loss, however it may be looked at. The buying public is prone to forget. It is, moreover, much more difficult and much more expensive to regain a lost customer than to prevent his straying away.—Money Maker Magazine, Chicago.

## CANADA'S COMMERCIAL AGENTS.

FOLLOWING is the correct official list of Canada's Commercial Agents in Great Britain, British possessions and foreign countries:

J. S. Larke, Sydney, N.S.W., agent for Australasia.

G. Eustace Burke, Kingston, Jamaica, agent for Jamaica.

Robert Bryson, St. John, Antigua, agent for Antigua, Montserrat and Dominica.

S. L. Horsford, St. Kitts, agent for St. Kitts, Nevis and Virgin Islands.

Edgar Tripp, Port of Spain, Trinidad, agent for Trinidad and Tobago.

C. E. Sontum, Christiania, Norway, agent for Sweden and Denmark.

D. M. Rennie, Buenos Ayres, Argentine Republic, agent for Argentine Republic and Uruguay.

In addition to their other duties, the undermentioned will answer inquiries relative to trade matters, and their services are available in furthering the interests of Canadian traders:

J. G. Colmer, 17 Victoria street, London, S.W., England.

Thomas Moffat, 16 Church street, Cape Town, South Africa.

G. H. Mitchell, 15 Water street, Liverpool, England.

H. M. Murray, 40 St. Enoch Square, Glasgow, Scotland.

Harrison Watson, Curator, Imperial Institute, London, England.

The international exhibition at St. John will open on September 11th and continue until September 20th. $13,000 will be offered in prizes and the amusement features will be especially attractive.

The Beecher family is one whose branches are very many and whose lines of work are as varied as the individuals. It is a grandneice of Henry Ward Beecher, Mrs. Charlotte Perkins Stetson, who is at present very much to the fore in relation to the enonomic emancipation of women. In the July number of The Cosmopolitan Mrs. Stetson will wage a pen warfare with Prof. Harry Thurston Peck over an article in the June number of The Cosmopolitan, "The Woman of To-day and To-morrow."

## WHAT IS WASTE IN LUMBER MANUFACTURING.

THIS is a pertinent question, in view of the oft-repeated assertion that our lumbermen are the most wasteful set of men in any industry. For years the cry has gone forth that the lumberman is wasting much of the forest product. The ordinary mind has come to accept this assertion as gospel truth, and most people actually believe that the average lumber manufacturer is outrageously wasteful and extravagant in his method of turning the greatest and noblest of natural products into a commercial article.

There is scarcely an instance of anyone disputing this commonly-received opinion, and it may be considered bold to do so at this late date. Nevertheless, the so-called fact is to a great extent no fact at all, but simply a mis-statement, or a misunderstanding of economic conditions.

Literally and strictly speaking, waste is that which is needlessly thrown away; that which might be saved by proper management.

A thing thrown away that could not have been saved except at an expense equalling its value after it had been saved is not really wasted when thrown away.

It is claimed that from 20 to 40 per cent. of the gross forest product goes into refuse in the process of manufacture, but to say that this 20 to 40 per cent. is wasted is a stretching of terms. In utilizing any natural product only so much of it will be turned into merchandise as can be sold above cost of manufacture. No business can or will continue long on a bare cost basis.

With this understanding, the only question that arises is, does the lumber manufacturer throw away anything which he can market? Or the question may go farther: Does he throw away anything that he could market at bare cost?

Much material, handled at a good deal of cost for labor, becomes mere refuse, and is thrown away. Every lumber manufacturer aims to sell every bit of product for which he can get back the bare cost of the labor he has been obliged to put into it in order to separate it from that part of the product from which his profit comes. The cost of labor expended on any portion thrown away must be added to the price of the merchantable part before there can be any profit in that. Hence, every bit of the product that can be sold for the cost of the labor put into it, adds that much to the average value of the profitable part of the product; and carrying this reasoning still farther, it follows that this latter part can be sold cheaper in proportion to the smallness of the amount thrown away as unsalable except at a loss.

### NO AVAILABLE MARKET.

There is very little of the forest product that is not usable or salable. The only question is whether it can be used or sold so as to cover cost or make a profit in the handling. The lumberman's slabs and edgings are all salable, and all be eagerly bought if in the market; and every lumberman would be glad to sell them, instead of consigning them to his "hell"; but when a cord of white or yellow pine or maple slabs and edgings that actually costs, say $3 a cord, to cut into lengths and load on cars at the mill, and $3 a cord for freight, besides switching charges and cost of unloading, sells at $6 a cord, carload lots, in some town like Chicage, St. Louis, or Milwaukee, it is nonsense to call the mill-man wasteful for running these slabs and edgings into the "hell," instead of shipping them to market.

If piling up and holding the sawmill refuse until such a time as a profitable market could be found were possible, then the question of waste might arise, but this is very seldom possible, for all mill refuse is exceedingly perishable and soon loses whatever value it might have had in the first place. It deteriorates much faster than market conditions ever improve.

But slabs and edgings are a small part of the refuse of lumbering. A large part never leaves the forest. Another large part is in broken bits, bark and the dust made by the saws. This latter substance is now much utilized in making steam where soft woods are manufactured, but with the hardwoods that is almost out of the question and the furnace fires are fed with the heavier refuse, such as slabs and edgings. To that extent in hardwood mills the slabs and edgings, and in pine mills the sawdust are of real value, and they to that extent ought to be deducted from the total of the refuse.

If lumbering could always be carried on close to towns, the question of what is waste and what is not would be greatly simplified; there would be almost no refuse, as nearly the entire forest product could be turned to merchantable account, at cost, anyhow; and to that extent the average cost of the more valuable product of the lumber would be lessened.

But in the nature of things that is impossible. The necessities of civilization, especially of the rushing, pushing, somewhat hurly burly civilization of the United States, has demanded the manufacture of lumber under conditions that absolutely forbid utilizing more than 60 to 80 per cent. of the forest product. To say that the other 20 to 40 per cent. has been wasted, is to dispute the necessity for those conditions, which is quite another thing.

### WASTE WAS INEVITABLE.

Had the timber in the great forest states of the northwest been cut and utilized only under conditions that would have permitted the merchandising of practically all the forest product, where would the great empire of the central west be to-day, and what would be the condition of the great prairie states now teeming with millions of population, busy industries and happy homes. That there has been some waste in the destruction of the forest is beyond dispute. Occasionally this may be laid at the door of the lumbermen, who, in their haste to get rich, utilized only that part of the forest product which would yield large profits. But those instances have been rare, and were happily confined to a very few years as far as the great pine states have been concerned. Under present conditions there is really little actual waste. That is, little or none of the gross forest product is thrown away which can be sold even at cost, and as civilization with its wants and its small industries is crowding closer and closer around the sawmill, every year shows a great decrease in the amount of actual refuse or worthless product.

In the old eastern states there is little refuse, little of the forest bulk but that yields at least cost, and the percentage that pays a profit has grown very large there compared with the newer northwest. The time is not far distant when in all states where any lumbering will continue, there will be practically no forest material thrown away except the bare twigs and leaves, and perhaps they too may, in the near future, be utilized to the extent at least of the cost of gathering them, either for fertilizers or for use in some chemical processes whereby valuable substances may be extracted at a profit.

There is undoubtedly at present a larger proportion of the southern forest going into refuse than elsewhere east of the Rocky mountains, and this results from conditions stated heretofore, such as want of market for anything but the regular products of lumbering, and the absence of a crowding population and small industries to utilize the refuse.

But even in the south there is an improvement in some respects, industries are making in that direction, and certain processes for the conversion of refuse into merchantable products are being introduced which bid fair to change the conditions greatly. What is waste under one condition is not under another. For instance, with corn high and coal cheap and within easy reach, it would be wasteful for the western farmer to burn his corn; but that question was reversed when the conditions were.

There is much the same condition in mining coal as in the manufacture of lumber. Around the great mines of Pennsylvania and Ohio there are doubtless millions of tons of coal dust that are practically refuse and worthless at present because not marketable under present conditions, even at cost. Still, the production of such refuse is a necessary concomitant of that business, and no one claims it is a waste to run that dust into ravines and out-of-the-way places, to lie there unused. Why not apply the same reasoning to the sawdust heaps and slab piles, or the refuse burners of the lumberman, and stop the everlasting hue and cry of the lumberman's extravagance and criminal waste?

The real waster of the forests of this country has been the settler, the farmer who has chopped down and burned upon the ground many times the amount of timber that all the lumbermen of the couutry have ever run into their refuse heaps. The settler or farmer has been a much more wanton destroyer of the forests than the most reckless lumberman ever known.—O. S. Whitmore, in The Tradesman.

## CORRESPONDENCE

Letters are invited from our readers on matters of practical and timely interest to the lumber trades. To secure insertion all communications must be accompanied with name and address of writer, not necessarily for publication. The publisher will not hold himself responsible for opinions of correspondents.

### ENQUIRY FOR BROOM HANDLES AND SKEWERS.

LONDON, ENG., June 15th, 1899.

Editor CANADA LUMBERMAN:

DEAR SIR,—A London firm of importers asks me for names of Canadian producers of basswood handles, wood blocks of red pine for flooring and paving, and manufacturers of skewers (wooden). I have given several names, but should be pleased to hear from any firms who would like to be placed in communication with the house making the enquiry.

Another recent enquiry which might interest your readers is from a house in the Midlands claiming a large connection in the chair trade, who wish to hear from Canadian producers of chair parts cut out from birch and sawn to shapes ready for cutting up. The firm in question considers that there is an opening for just development in this line. Canada already does trade in chair parts, but there are probably houses which might like to take the matter up.

Any communication or information addressed to me will be placed before my correspondents.

Yours faithfully,
H. WATSON,
Curator Canadian Section, Imperial Institute.

## PROTECTION OF LIMITS FROM FIRE.

A meeting of the timber limit holders, district No. 1, of the province of Quebec, called by Mr. M. McCuaig, superintendent of fire rangers, was held in Ottawa recently. Mr. Robert Henderson was appointed chairman, and Ald. R. J. Davidson secretary. There were present Messrs F. P. Bronson, representing the Bronson-Weston Lumber Company, Ottawa; Robt. Hurdman, representing the Sheppard-Morse Lumber Company, of Burlington, Vt.; Hon. Peter White, representing the Pembroke Lumber Company; David Gillies, M.P.P., representing Gillies Bros. Lumber Company, of Braeside; W. H. Rowley, representing the E. B. Eddy Co., Hull; Armon Burwash, representing McLachlin Bros., Arnprior; Ald. R. J. Davidson, representing Davidson & Thackray, Ottawa, and John Charlton, M.P., representing Charlton Bros.

It was moved by Messrs. Gillies and Hurdman that a committee, consisting of H. K. Egan, R. Hurdman and D. Gillies, be appointed to obtain the signatures of the license holders of the Ottawa Valley in district No. 1, to a petition to be presented to the commissioner of crown lands and the Quebec Government, asking that the regular number of fire rangers be increased to at least 50 to protect Ottawa limits as far as possible from fire.—Carried.

It was also moved by Messrs. White and Gillies, that, in view of the fact that the Province of Quebec is equally interested with the license holders in the prevention of forest fires, the Government be requested to adopt the system prevailing in Ontario in the appointment of fire rangers.—Carried.

## A SAWDUST MACHINE.

A new machine designed to convert sawdust into commercial products was recently brought to the attention of a number of Ottawa lumbermen by the inventor, Mr. H. Spurrier, of Montreal. The inventor says that his machine has passed the experimental stage, and has been successfully worked. He says it is about the most economical method yet discovered. The machine is like a large cylinder, and is usually covered in with bricks. Running through the centre of the cyclinder is a large hollow shaft with a worm shaped like the flanges of a bolt. The screw-shaped shaft is covered with metal, but around this is another screw-like contrivance enclosed in metal. The sawdust is introduced into the spaces betwen the flanges on the inner shaft and in turning the dust is carried along the shaft to the other end and there escapes to the outer shaft, and after passing along to the end escapes by an outlet into a receptacle where the dust—which is charcoal after the above process—is deposited. The dust in going through the cylinder passes over heated surfaces, and as the screws keep turning the dust is kept moving and the heat is well distributed through the mass.

The gas separated from the sawdust by the heat passes through a pipe into a condenser and issues from this as acetic acid and wood tar. These two products can be further refined and other valuable products secured. Mr. Alfred Benn, commercial agent of Montreal, is associated with Mr. Spurrier. They expect to organize a company, with headquarters either in Montreal or Ottawa, to use the machines in manufacturing commercial products from sawdust.

## SUCCESSFUL CULLERS.

The annual examination of cullers for the district of Ottawa was held at Hull, Que., on Saturday, June 17th, the examining officers being Messrs. Gilson, Derome and Pozie, of Quebec. Mr. F. A. Gendron, crown timber agent, acted as superintendent. A roll-way of logs was prepared on the shore of the Ottawa river, and the candidates were called upon to measure and cull them.

The list of successful candidates is as follows: J. H. Cameron, Buckingham; Alph. Martel, Three Rivers; Louis French, Hammond, Ont.; J. R. Rene, St. Gabriel de Brandon; Olivard Robitaille, Gatineau Point; F. G. Woonsdorf, Pembroke; Herbert Carr, Point Alexander, Ont.; Nap. Charest, Gatineau Point; E. J. Belisle, St. Andre Avellin; Telesphore St. Jean, Gatineau Point; R. C. Perrier, Buckingham; Jeremie Alix, Chute Aux Iroquois; S. Richardson, L'Orignal; Peter Le Roy, Grenville; Henry Row, Buckingham; Chas. Major, Montebello; J. P. Sarisan, Buckingham; A. T. Buchan, L'Orignal; Hugh Martin, Buckingham; S. Pouliot, Rockland; S. Surtees, Rockland; M. Galibeau, Hull; John Miller, Ottawa; W. B. Bertram, Billings Bridge; Ovice Latullup, N. Desmarais, Alf. Sauve, N. A. Sauve, John McGreen, Buckingham, Hull; A. R. McLachlan, G. A. Berminer, Arnprior; J. L. Close, John Yuill, H. Cailler, Arnprior; M. Beland, Gatineau Point.

## ONE HUNDRED YEARS IN BUSINESS.

The firm of Messrs. Irvin & Sellers, sawmillers and timber importers, Liverpool, Eng., enjoy the unique distinction of having celebrated its one hundredth year of unbroken existence in business. The business was first established by Mr. John Irvin, who in the closing year of the last century commenced the manufacture of shuttles in the small town of Preston. In those early days of shuttle making box-wood was almost entirely used, and to those accustomed to the shuttle of the present day and its manufacture by modern machinery, but little of the arduous labor then involved in its construction by hand labor can be appreciated. Hand labor soon gave place to steam power, and the business gradually extended, the manufacture of bobbins being entered upon. In January, 1851, the founder of the firm died and was succeeded by his youngest son David, who is now the senior partner of the firm. Although at the ripe age of eighty-three years, he is still in the enjoyment of vigorous physical and mental powers. At the present time the firm is composed of Mr. David Irvin and his grandson, Mr. W. B. Irvin, who have built up an extensive business as sawmillers and timber manufacturers, having their mills at Preston, head office at Bootle, Liverpool, and branches at London, Glasgow, Birmingham and New York. At the present time they are giving considerable attention to the Canadian trade, and will pe pleased to receive correspondence from manufacturers in this country.

Work on the development of the water power at Shawinigan Falls, Que., has been commenced. A syndicate, promoted by Messrs. Greenshields, has guaranteed to spend a large sum of money on calcium carbide works, and a United States concern, it is said, propose to erect large paper and pulp mills.

## PRACTICAL NOTES.

In the latest patent barrel the stave is wedge-shape, tapering from end to end rather than from the middle to the ends, and in making the barrel the wide and narrow ends are placed alternately. By this arrangement the barrel is given the essential swell at the center. For handling commodities of finer composition it is proposed to make a barrel consisting of two layers of these staves, one within the other, the staves of the outer layer being reversed with relation to those of the inner section.

The most objectionable of all methods of emptying and cooling a boiler is to blow it out under pressure, and afterwards run cold water in, in order to cool the shell still more rapidly. This arrangement really consists of emptying the boiler as described in the preceding and then cooling the plates by running cold water in. This plan should never be adopted; it is always likely to seriously injure the boiler. The sudden strains which are set up by the cold water running on to the hot plates may set up concealed fractures through the line of rivet holes forming the seams, which cannot be detected in the ordinary way, and which may lead to explosion and loss of life when the boiler is again worked.

CARE OF FILES.—If files have been used for working on wrought iron and are clogged with iron filings, says an American exchange, the file should be immersed for a short time in a dilute solution of sulphate of copper. The solution will completely remove the objectionable filings without affecting the file itself. Zinc filing can be dissolved with dilute sulphuric acid. Files which have been used in filing copper, or in filing the spelter from around frame joints, may be cleaned and sharpened by dipping in dilute nitric acid. It must be understood that before the files are immersed in the acid as much of the coarser filings as possible be removed with a file cleaning brush, and that the files be cleaned so that there shall be no grease of any kind present to hinder the action of the acid. Grease can be best removed from files by treating them in a dilute caustic alkali.

BELTING.—When a belt becomes badly oil soaked, and the pulleys have oil on them, it is well to sprinkle fuller's earth or prepared chalk on the belt. This will absorb the oil. Scrape off the residue with a piece of flat wood, slightly sharpened. A solution of salt on pulleys roughens the leather and helps to overcome some of the slip. Anything that acts as an unguent should be kept from a belt. If oil comes in contact with gum belts it softens them. If water gets between the canvas and the seams, and then freezes, it separates the layers. Even a frosty pulley in contact with a gum belt tears the seams from the canvas. Boiled linseed oil lightly applied on the pulley side of a gum belt will help to overcome slipping, caused by dust, etc. Gum belts are now used with success in damp or wet places in preference to leather ones. These belts cannot be successfully used at half cross or on cone pulleys.

JOINTING BELTS.—Endless belts while not in general use on lathes or similar machinery, are of great advantage and deserve to be used more than they are. A slight drawback is the lack of means ot taking up the slack, such as is obtained with dynamos and motors, instead of requiring the joint to be opened and reglued, which is something of a nuisance. A means of avoiding this, says American Machinery, is to glue the joint with a piece of paper the full size of scarf intervening. While the pull of the belt lengthwise is easily resisted by the paper, it can readily be split by opening the corner of the joint sufficient to get a grip with the finger and thumb, a moderate pull from which will open the joint, when the belt can be shortened, rescarfed, and glued up with paper in between. Another way to open such joints is to place a moderately small sized wire in the middle of the joint and allow sufficient length to project out, so that the two ends can be folded over the outside of the belt and twisted. When the joint is to be opened the ends of the wires can be pulled steadily by pliers, and half of the joint is soon opened, then the other half can be opened by pulling by hand or by a second wire inserted in the joint. Of the two methods of opening the joint, as proposed by our contemporary, the first method, by paper in the joint, appears to us preferable, but care would have to be taken to use a paper that would split readily. A wire on outside of the belt would be inconvenient, and liable to tear the hands of the workman, in the case of a lathe belt for instance, that has to be shifted so much by hand.

Mr. Madison Williams, Port Perry, Ont., reports recent bookings of orders as follows: 30½ inch Vulcan for Toronto Lime Co., Limehouse; 40 inch Leffel for C. Spencer, Ursa, Ont.; 13¼ and 23 inch Leffel for Austen Bros., Halifax, N. S.; 52 inch Special Leffel for F. Sanford, Fenelon Falls, Ont., and two 61 inch Vulcans for the monastery of The Good Shepherd, Parc Laval, Que., making five turbines of this size for the same institution within 8 months; also several saw mills and orders for heavy gearing, pulleys, etc., for the Eastern provinces. Mr. Williams has recently remodelled his machine shop, adding greatly to the facilities for handling the different parts of the very heavy wheels under way.

# WOOD PULP DEPARTMENT

## PULP MILL OF THE ST. JOHN SULPHITE FIBRE COMPANY.

THE new mill of the St. John Sulphite Fibre Company, at Mispec, St. John N. B., has just been completed, under the supervision of Mr. M. F. Mooney. The mill has a capacity of 30 tons per day, but provision has been made for increasing the capacity. Additional machinery can be placed in all the principal buildings and the output greatly augmented without changes in the buildings themselves.

The mill was planned by Mr. Mooney, who was for a time the manager of one of the pulp mills at Chatham. It was built by B. Mooney & Sons, of which firm M. F. Mooney is a member. Having made the necessary arrangements for the site, Mr. Mooney sent the plans to Scotland, where the scheme found favor in the eyes of a number of capitalists.

The mill is situate on the bank of the Mispec stream, about 15 miles from Loch Lomond, and a distance of some 10 miles from St. John. The buildings, which are of brick, are substantially put together and cover an immense area. Nearest the stream is a building with a frontage of 430 feet and extending back 68 feet. It contains the wood room, machine room and boilers. Back of the wood room and above it is the acid system, which extends back about 120 feet. This structure is 150 feet in length. Above this department is the sulphur room, which is one story high and 120x40 feet. The digester building occupies a still higher level, and is 130x36 feet. The main portion of this structure is 100 feet high. The blow tank building and filtering plant are between the digestor building and the paper making department. It is one story above the machine room and one floor below the digestor department, which places the blow tanks sufficiently below the digestors to cause the pulp to flow by gravity into them from the digestors.

The logs will be taken up into the wood room by means of a patent haul up, and cut by two steam jump saws into lengths of 2 feet 6 inches. These pieces will be carried by a conveyor to the barkers' machines, fitted with knives which will remove the bark. From the barkers the cut up logs will be moved along on a conveyor to the chippers, machines which will cut them up into chips. Immediately under the chippers and on the floor beneath are chip breakers which will break these chips up into the desired sizes, five-eighths of an inch long and from one-sixteenth to one-eighth of an inch thick. These small pieces of wood will next pass through the shaker, which will separate the sawdust and slivers from the chips and deposit the latter on a conveyor which will carry them up to the chip loft in the digestor building. This loft is spacious enough to hold 160 cords of chips, which will be sufficient to keep the mill going when increased to its fullest output for 24 hours. The chips will be placed in the digestors, two immense iron tanks, each capable of turning out ten tons of pulp at each cook. The digestors will be filled with chips and 20,000 gallons of sulphurous acid put in. Then the digestors will be made steam tight, and steam will be admitted at the bottom and the temperature brought up to the desired point and kept at that till the wood is cooked into pulp, which will occupy from 10 to 14 hours. The pulp will flow from the digestors to the blow tanks, which are 20 feet beneath the bottom of the digestors. These tanks are hard pine vats, 28 feet long and 18 feet in diameter. The pulp will be washed in them and acid and resinous matters removed. Then it will go to the pulp opener, where the fibre will be opened up, and next to the riffler or sand trap to be further cleaned, and after to the stuff chest in the machine room. From this chest the pulp will pass on to the first screens and from them to the paper machine, which will run it out and dry it in sheets similar to paper. At the end of the last mentioned machine there is a reel which will wind the pulp up into rolls. The slitting and cutting machines having done their part, it will go into the baling press, where it will be made ready for shipment.

That there is ample water power to run the mill is apparent. The stream has been dammed at a spot where the greatest power possible to be obtained can be had. The dam, which is built of solid masonry, is 54 feet high and 240 feet long at the top. Its length at the bottom of the gorge is 80 feet. It is 120 feet wide at the base, and tapers off to eight feet at the top. The stone work is faced with timber on the water side. The flume, which is made of iron, is five feet in diameter. It leads from the dam on the surface of the ground down to the water wheels in the mill, and is 830 feet long. There are four water wheels in all, one for each department,

which will develop 600 horse power. In addition to this the company have a 250 horse power compound steam engine as an auxiliary in case the steam gets blocked up at any time. In the boiler room they have 500 horse power of steam boilers for use in the cooking and drying of the pulp. A pipe runs through the flume, by means of which the water required for the boilers is taken into the mill.

A most complete electric lighting plant has been put in. There are 350 incandescent lamps distributed throughout the establishment, and the yards will be lighted by 10 arc lamps. The mill is fitted with steam heating apparatus, and there is an excellent system of automatic water sprinklers for use in case of fire. Two pumps have been installed, each of which will throw 1,000 gallons of water per minute. The water for the sprinkling apparatus is stored in tanks in the tower of the digestor building, which have a capacity of 20,000 gallons.

The Dufferin Falls Pulp and Paper Company, which begins operations this season, will be one of the largest pulp producing concerns in Canada. This company, composed of Messrs. W. and F. P. Currie, James T. Shearer, M. S. Foley, Hon. J. A. Ouimet, W. T. Fee, and others, of Montreal, has secured an area of 1,410 square miles along the Du Lievre river for the sum of $130,000, including mills at Buckingham, and last year, during Mr. Foley's trip abroad, he is said to have made arrangements for a yearly delivery of 50,000 tons of sulphite pulp.

## A RUMORED PULP COMBINE.

On the authority of "Paper," of New York, it is stated that steps are being taken by Mr. J. Laurence Whitcomb, a London promoter, to form a combine of ten Canadian pulp mills, having a production of about 400 tons per day. The proposition is to increase the capacity within a year to 600 tons per day. The journal above referred to says :

"A company is to be organized to purchase the properties of the various concerns to be included in the combination, and this company will, in all probability, be known as the Canadian Pulp Company. It is to be capitalized at $10,000,000, and will operate under a special charter granted by the Canadian Parliament. The capital stock is to be divided into $5,000,000 preferred, bearing 7 per cent. cumulative dividends, and $5,000,000 common stock, which, it is thought, will pay all the way from 5 to 10 per cent.

"The new company will send the majority of its pulp abroad to be manufactured into paper, but it is quite likely that contracts will be made with a number of United States paper mills outside of the news trust to supply them with pulp, providing the United States and Canadian Joint High Commission make it possible to import the pulp at a profit. In such a case the company would be, to a certain extent, a competitor of the International Paper Company.

"The capital stock has been all subscribed for in London and Berlin, and the company expect to be in operation within a few months.

"The following is a list of the mills which Mr. Whitcomb would like to include in his combination :

| Name. | Capacity Per Day. Tons. | Proposed Increase. Tons. |
|---|---|---|
| Chicoutimi Pulp Co., Chicoutimi, Que.... | 30 | 50 |
| Canada Paper Co. (2 mills)— | | |
| 1. St. Raymond mill..... | 10 | . |
| 2. St. Antonin mill..... | 20½ | .. |
| Hamelin & Ayres, Lachute, Que..... | 30 | .. |
| Sault Ste. Marie Pulp & Paper Co., Sault Ste. Marie, Ont..... | 250 | .. |
| Sturgeon Falls Pulp Co., Sturgeon Falls, Ont..... | 20 | 100 |
| Sissiboo Falls Pulp Co., Weymouth Bridge, N.S..... | 12 | 30 |
| Acadia Pulp & Paper Mills Co. (2 mills)— | | |
| Milton, N.S..... | 65 | .. |
| New Germany, N.S..... | .. | ... |
| Nova Scotia Wood Pulp & Paper Co., Mill Village, N.S..... | 10 | .. |
| Totals..... | 429½ | 180 |
| Grand total..... | | 609½ |

The inquiries of the Laurentide Pulp Company for iron pyrites in Ontario, carrying a high percentage of sulphur, have elicited the fact that A. W. Carscallan, M. P., has a mine at Marmora, Hasting County, that is nearly pure sulphur, and that H. Corby, M. P., has one at Malone, in the same county, that will considerably exceed 40 per cent.

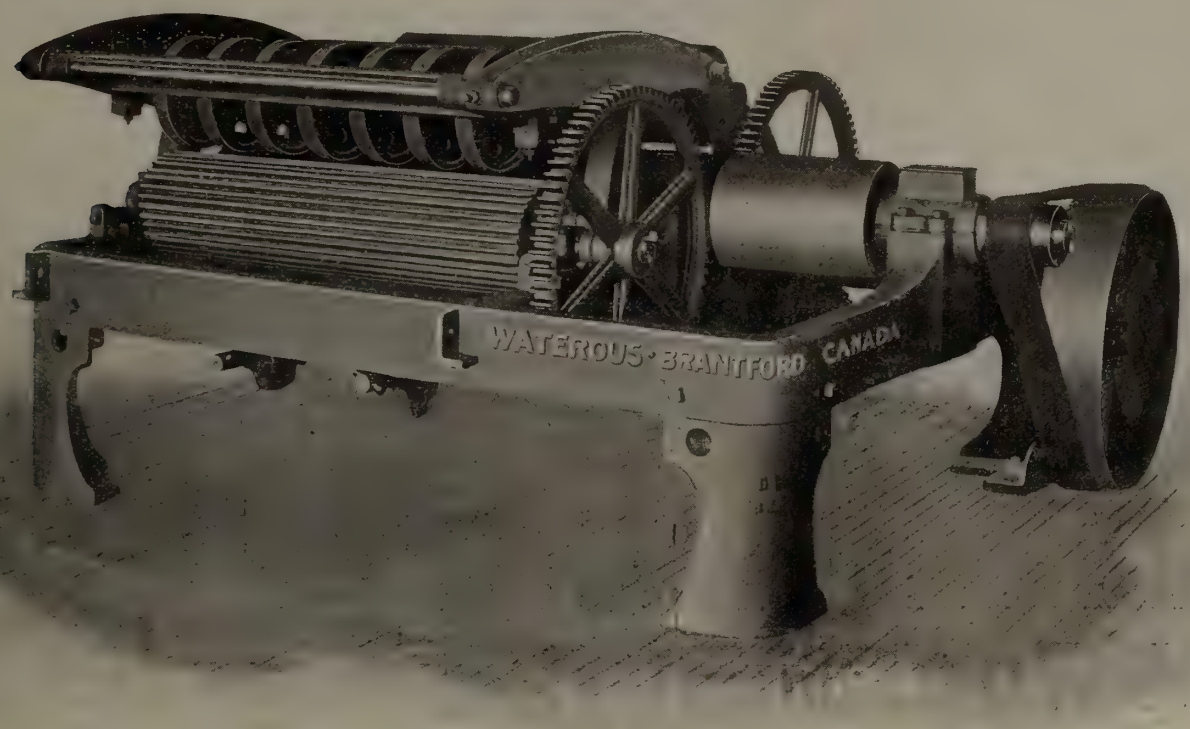
# .. WATEROUS ..
# IMPROVED CHAMPION DOUBLE EDGER

**All Manufacturers are forced in these days of sharp competition to invest in up-to-date Machinery, increasing the output per man, thus lowering the cost of production—Lumbermen are no exception to this rule.**



## THIS IMPROVED DOUBLE EDGER

is made in three grades—Light, Heavy and Extra Heavy. **Press and Feed Rolls** are of large diameter. Feed rolls fluted, bearings adjustable, front press rolls made in sections, both front and back hung in stiff open frames LIFTING WITH FEED NOT AGAINST IT—a new and important feature—ADJUSTABLE BOTH WAYS FOR ALIGNMENT WITH MANDREL. Rolls sufficiently large to be used for return of stock over edger, and still view of saws is not obstructed—all have bridgetree quickly removable to take off saws—Saws are moved by guides and guides are removable to take off Saws.

**The Light Champion Edger** has strong box frame cast in one piece, supported with four legs. Mandrel, 2 7-16 steel, supported on two long bearings.

No. 1 Champion has two Saws, one movable ; range between Saws from 1¾ to 22 inches.

No. 2 Champion has three Saws, two movable ; range between stationary and first movable Saw, 1¾ to 18¾ inches, and between movable Saws 4 inches.

Both are provided with front tables, with 4½″ rolls and guide, movable with lever up to 4 inches inside of stationary Saw.

**The Heavy Champion Edger** shown in illustration has heavy box frame supported on six legs. 2⅞ steel mandrel supported in three bearings of ample proportion, reducing the pressure to the square inch of wearing surface to a minimum, permitting the greatest speed.

The Pulley is carried between two heavy bearings cast in one solid box-shaped frame.

**Front and Back Press Rolls** arranged as in the Light Edger, are carried in box-shaped uprights connected and braced together to prevent springing and twisting of frame.

No. 3 Heavy Champion has 3 Saws, 2 movable ; range between stationary and movable Saws 1¾ to 24¾″, and third Saw 4″ from second.

No. 4 Champion range is 1¾″ to 28¾″, and third Saw 4″ from second.

No. 5 Champion range is 1¾″ to 36¾″, and third Saw 4″ from second.

A fourth Saw can be added te these Heavy Edgers, reducing the extreme opening 4″.

**The Extra Heavy Champion Edger** has a box frame in appearance much the same as the Heavy Edger.

No. 6 Champion has 3 7-16 mandrel, with 5 saws—2 stationary, 3 movable—divided press rolls, for two men to edge at once ; two movable guides on front table. Greatest width between first and second Saws, 34 inches.

No. 7 Champion has 3⅞ steel mandrel, with 6 Saws, and otherwise same as No. 6.

## A MODERN SAW MILL.

IT will be remembered that about one year ago the saw mill of Mr. J. D. Shier at Bracebridge, Ont., was completely destroyed by fire. Mr. Shier at once decided to rebuild, and in the winter of 1898-99 erected the mill shown in the accompanying illustration. This mill is 34 x 72 feet, with wing 26 x 64 feet, three stories high, and separate engine and boiler room. Power is furnished by three large boilers driving a 150 h.p. Waterous engine. In the lower story is situated the shafting, driving pulleys and carriers, and from this story the refuse of the mill is carried to the burner. The second flat contains the mill proper. Being desirous of erecting a mill modern in every respect, Mr. Shier investigated the merits of the recently invented double cutting mill, with the result that one of the Allis Telescopic band mills, as manufactured by the Waterous Co., of Brantford, was installed. It is worthy of note that this mill was the first one of the kind to be installed in Canada, and at that time was the second in operation in America, although other mills have since been put in. Mr. Shier appears to be well satisfied with his decision to put in a double acting mill, and states that he regards it as a model of perfection in saw mill construction. It is substantially built, easily operated, and does its work accurately, while its cutting capacity is very largely in excess of any single cuting mill, as it cuts nearly as much by the reverse motion as is done by the usual single saw. The lumber cut on the reverse motion passes by means of a system of rollers to the rear of the mill, returning to the edger by a carrier chain under log-way and back of band mill.

Situated on the same floor with the band mill are the edger, trimmer, and lath mill. The filing room on the third flat is fitted up with a complete set of band saw filing and fitting tools, the machines being driven by an engine located on the same flat.

Many persons have visited Mr. Shier's mill, and the generally expressed opinion has been that it is one of the most complete and up-to-date mills in Canada, and one with which the owner has reason to be pleased. Its cutting capacity has been tested with nearly all kinds of woods, both hard and soft, the tests having demonstrated that it will cut deals and half-inch boards with equal accuracy. The efficiency of this mill reflects credit on the Waterous company, who furnished nearly all the machiney.

We are pleased to present on this page a portrait of Mr. Shier.

MR. J. D. SHIER.

MR. J. D. SHIER'S NEW SAW MILL AT BRACEBRIDGE, ONT.

## WHY BAND SAWS CRACK.

BEING asked for an opinion as to why band saw blades, especially those narrower than two inches, crack, E. C. Atkins & Co., the saw-makers, furnished the following :

There are a great many causes for cracking in band saws. The character of the material may not be satisfactory for the work or the temper may be too hard or too soft. The teeth may be case-hardened from the use of the emery wheel, or the saw may be case-hardened on the side from the bearings of the guides. The very slightest case hardening is almost sure to crack a saw.

It is very necessary that narrow band saws have plenty of set, as they are almost sure to crack if run with a narrow set. Sometimes the guide stretches the back if the saw is run too loose on the wheels and is allowed to run against the back guide, and thus throws too much strain on the teeth edge and is apt to crack the saw.

Occasionally the machine is out of line and the wheels out of true, causing the saw to jump and have undue strain at certain points, which is another cause for cracking. The teeth should never be filed with square gullets. The gullets should be rounded off, for if left square they are almost sure to crack. The saw should be perfectly straight and true, should have no twists and should be kept in good order.

In reference to the best device for fixing a rubber or leather strip on the face of a band resaw wheel, we have found that these strips can be fastened on satisfactorily with ordinary shellac varnish, excepting that in warm weather the shellac is apt to become soft and allow the rubber to slip off. We use for our own band saw wheels prepared glue and have the rubber put on very tightly.

## TIMBER IN EUROPE.

IN countries where lumbering is a recognized industry the total area of timber lands amounts to 2,157,292,132 acres, according to official estimates. Of this total Europe has 716,101,412 acres, Asia 186,200,000, and America, 1,254,990,720.

In Europe the acreage of timber lands with the percentage to the whole is as follows : Portugal, 1,163,841 acres, 5.25 per cent. of total area ; Belgium, 1,243,507 acres, 17.08 per cent.; Greece, 2,025,400 acres, 12.60 per cent.; Switzerland, 2,259,018 acres, 20.12 per cent.; United Kingdom, 2,695,000 acres, 4 per cent.; Bulgaria, 3,291,100 acres, 12 per cent.; Turkey, 3,500,000 acres, 8.93 per cent.; Roumania, 4,942,000 acres, 15.22 per cent.; Servia, 5,763,163 acres, 48 per cent.; Italy, 10,131,235 acres, 14.31 per cent.; Spain, 16,354,941 acres, 13.03 per cent.; Hungary, 18,777,771 acres, 23.52 per cent.; Norway, 19,288,626 acres, 24.53 per cent.; France, 23,466,450 acres, 17.92 per cent.; Austria, 24,172,360 acres, 32.58 per cent.; Germany, 34,347,000 acres, 25.70 per cent.; Sweden, 44,480,000 acres, 40.65 per cent.; Russia, 498,200,000 acres, 37.15 per cent.

The British Columbia shingle manufacturers have a wise clause in their price lists as to the thickness of their shingles. It runs as follows : Sawn thicknesses are understood and are subject to whatever slight shrinkage may occur in drying. The mills get all the underweights.

## THE FRENCH MARKET FOR AMERICAN OAK.

It is well known that in consequence of the almost universal use of oak parquet flooring in France, the consumption of oak for this purpose is exceedingly large, and the trade shows continued signs of progression. Up till a few years back the forests of Austria-Hungary and Sclavonia were the principal sources of supply of the oak used for this purpose, the shipments being made principally through the ports of Trieste and Fiume. The wood, both in quality and color, being of that yellow tint dear to the French contractor, is admirably suited to the purpose, and the home-grown French oak, although always used to a large extent, being of a harder nature, could not compete with it, bearing in mind that in this country it is the custom for the builder or carpenter who lays the floor to guarantee it for ten years.

To this day much of the wood shipped from these forests is of the very finest quality, notably that which comes into France under the auspices of La Societe d'Importation de Chene and two or three other leading importers who from long experience know exactly what is wanted for this market, and take care to send nothing else. But the price is high, and in the nature of things competition was to be expected sooner or later, and it is therefore not to be wondered at that during the last few years a determined effort has been made by the London dealers to capture a portion of this large market for the magnificient oak production of the United States. Much of the wood grown is in character very suitable for the French parquet floor trade, and although perhaps in color it is rather too red for the liking of the connoisseur, this is in practice not proved to be an insurmountable object, and for the last few years the competition offered by the American to the Austrian wood has been gradually increasing, until to-day it is recognized by the shippers of the latter as a very serious rival.

The Timber Trades Journal, of London, than which there is no more competent authority, is of the opinion that there is room for a very considerable increase in this trade, and that it rests entirely with the shippers in the United States to bring this about by getting into closer touch with buyers at the British metropolis, and very properly urges the point that it is worse than useless to send anything but wood which in every respect suited to the market.

This journal says: "In the first place, the wood must be of first quality and free from sap. Let it be understood once and for all that sap-wood will not be used here for this purpose, and besides that, the greatest care must be used to send only wood which is free from knots and which has been properly dried and seasoned. The other point to which we would direct shippers' attention is the sawing, which must be carefully done, as any departure from the standard thickness entails extra and unnecessary work on this side, which is greatly resented. The standard sizes for thickness are 27, 35, 41 and 54 milimeters on boards 6 inches and upwards wide, lengths 6 feet to 9 feet and upwards. At the present moment the size 27 milimeters has been a little overdone, and the others are in better request. As to prices, good stuff is now fetching about 130 francs, c. i. f. Havre, per cubic meter —35 English cubic feet. The duty, charges and transport to Paris cost about 30 francs, making the price 160 francs, landed in the capital; but the business is generally done c. i. f. to the seaport, buyers paying freight and deducting from invoice.

"The Austrain wood is at the present time time fetching about ten per cent. better prices, and it enjoys a distinct advantage in being shipped by the direct regular line of steamers, Fiume Rouen, which is in many respects a cheaper port than Havre; in fact, these oak planks could be delivered in Paris something like ten francs per cubic meter cheaper through the latter port. We think this is worth the attention of some enterprising firm of shipowners."

The article quoted touches on but one of the uses for oak in France. A great deal of it is employed for furniture, interior decoration, cabinet work, etc., while the trade in oak stairs is in itself a very large business capable of great development.

With commendable enterprise the Journal puts its Paris office entirely at the disposition of American shippers who are anxious to share in this large trade, and states that it will be pleased to give any further information which they may require, or even to put them in communication with responsible agents and sellers in that country.—The Tradesman.

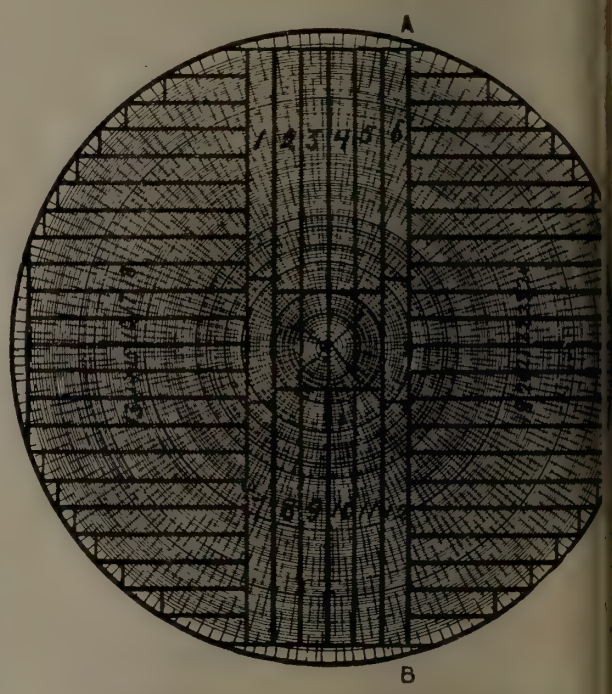
## QUARTER-SAWING OAK WITH A CIRCULAR SAW MILL.

The high prices that are now being paid all over the country for quarter-sawed oak make it particularly desirable that some plan be devised by which the saw mill man who is not specially fitted up for this class of work should be enabled to get some of the benefit of these gilt-edged prices.

The idea that oak timber cannot be quarter-sawed profitably with a circular saw mill, and without the use of special dogs to hold the quarters, seems to have got generally fixed in the minds of circular saw mill men. While there can be no doubt that the band mill is the best mill for this kind of work, and the duplex dogs are necessary when it is desired to make all the quarter-sawed lumber there is in the log, we have proven from our own experience that we can get 50 to 60 per cent. of the cut of the log, in a fine grade of quarter-sawed lumber, with no loss of timber, and with very little loss of time, with a double circular mill. Moreover, that portion of the lumber which will not pass as quarter-sawed lumber will cure better in this trying southern climate, and be more satisfactory, than if plain-sawed the usual way. Our plan may not be original, but we do not remember to have seen it published, and on that account we send you a drawing showing it, thinking it might benefit some one.

At the outset, no logs should be quarter-sawed, by any plan, out of a stock of large and small logs, that are less than twenty-six inches, or at the least twenty-four inches in diameter. While a fair average width of quarter-sawed can be got by this plan by using logs a little smaller, it would make the average widths of the plain-sawed firsts and seconds run too narrow. The primary object in quarter-sawed oak is not to bring the edge of the grain to the surface of the board, as it is in what is called rift-sawing in pine, but is to bring into view the peculiar glistening figure which comes from cutting the medullary ray or grain that runs from the center to the circumference of the log. Cutting this ray nearly or quite parallel with its line of direction will show the figure large, and as the angle of the saw cut becomes more obtuse the smaller the figure will show until it disappears entirely. And herein lies one feature of this great beauty of quartered oak. The variations of figure are almost endless. It would be almost impossible to pick out two boards figured just alike, and to find one board figured alike from end to end is not an easy thing to do. Any method of sawing oak that will get lumber which shows this figure is quarter sawing, no matter whether it is done by the orthodox way of opening and quartering the log and edging a bevel piece off each board or not. The drawing shows about the proportions of a twenty-six-inch log cut as we are now doing.

We first slab the log lightly on three sides, working the log down small enough one way so the lower saw will reach through from A to B. We then split the log at A and B, and let the portion at the right in the drawing back on the



Cross-Section of Log in Daniels' System of Quarter-Sawing.

log deck. This piece is not slabbed in the beginning, although it can be done if preferred. We do not, as it saves the time of one turning. We then cut off wide boards as long as the figure shows wide enough on the top and bottom edges; we take out the heart, or any portion that does not show the desired figure, with the edger; we turn what is left down on the flat side and saw it up, after which the piece lying on the deck is turned on the flat side and sawed up in the same way. We have no market for oak scantling or we would make a piece from each edge of these flat pieces, and not narrow strips as shown.

The numbered pieces in the drawing will usually show the figure, but the amount will vary in different logs. If a piece should not show the figure it is not lost, but makes desirable plain-sawed lumber, inasmuch as it does not check in seasoning and keeps its place better when put into work. Of course, a top saw is absolutely necessary in quarter-sawing with a circular mill, but no special dogs or devices are necessary by this method. We have tried all the various plans, and we doubt very much if we should work on any other plan than this, even if we had a band mill.—Howard Daniels, in Dixie.

## MR. JAMES M. MACOUN.

It is with much pleasure that we present the accompanying portrait of Mr. James M. Macoun, Assistant Naturalist of the Geological Survey of Canada, and who is in charge of the Canadian forestry exhibit for the Paris Exposition. Mr. Macoun has been connected with the Geological Survey since 1883. During the past sixteen years he has travelled over much of the unexplored portions of Canada from Labrador and Hudson Bay and the northern wooded country to British Columbia. During these years he has paid particular attention to the forests and possible forest products of the regions traversed. His acquaintance with these little known regions

Mr. James M. Macoun,
Superintendent of Canadian Forestry Exhibit for Paris Exposition.

and the interest he has always taken in all matters pertaining to forestry were his chief recommendations for the position to which he has been appointed. We feel assured that no effort will be spared by Mr. Macoun to make a display creditable to Canada. Mr. Macoun was the Canadian Commissioner during the recent Behring Sea seal investigations, and represented Canada at the Washington conference in 1898.

## QUESTIONS AS TO INSPECTION.

A reader of the Canada Lumberman asks: "Is a board that will work up more than one-half good a mill cull, even if it has a show of heart in it?"

Another lumberman has submitted the following questions: "(1) In log run, can a buyer measure out the defects; if so, to what extent? (2) If there are two or more splits in the end of a board, can a buyer measure them out; if so, in what grade? (3) In purchasing a lot of elm logs "log run," can the hearts be measured out if they are not sawed out? (4) Should it be necessary to give the manufacturer orders to saw the hearts out? (5) Are there any persons appointed by the government or by the Lumbermen's Association for the inspection, grading and measuring of lumber?"

We would be pleased to receive from our readers answers to any or all of the above questions.

Steps are being taken to oppose the application recently made to the government of British Columbia for the lease of timber limits exceeding many thousands of acres on the north fork of Kettle river. It is contended that the syndicate, far from proposing to operate sawmills, simply requires a grant for speculative purposes.

ELI

Mr. L. G. LittleJohn, a member of the colonial firm of Scott, Henderson & Co., Sydney, N. S. W., was in Toronto last month. His visit to this country was to stimulate trade between Canada and her sister colony. Speaking of the trade from the United States to Australia, he stated that doors manufactured in the United States of Canadian lumber were quoted by the manufacturer at a lower price on board vessel at New York than by the Canadian mill owner at his own siding, notwithstanding that the United States manufacturer had to pay a duty of $2 per thousand feet upon the lumber which he used.

* * *

The recent foreign visitors to Canada included Mr. L. R. Babbitt, of Babbitt Bros., wholesale merchants, Beunos Ayres, South America, his purpose being to arrange for shipments of Canadian lumber. Mr. Babbitt states that the Argentine Republic offers a good market for Canadian timber products, and that last year that country imported 48,000,000 feet of white pine, 68,000,000 feet of spruce, and 88,000,000 feet of pitch pine. The Argentine Republic is probably the most highly protected country in the world. It has no timber of any account, yet some 200,000,000 feet of North American lumber imported last year had to pay a high tax. The freight, he says, from Portland, Boston and other ports averages about $9.50 a thousand, so that, with the original cost added, the lumber is laid down in the yards at Buenos Ayres at a fancy figure. The lumber retails from $40 to $80 per thousand feet, according to grade.

* * *

A welcome visitor to Toronto a few days ago was Mr. Donald Podmore, member of the firm of Sieveking, Podmore & Co., timber importers, of London, Eng. Mr. Podmore visited the chief lumber producing centres of Eastern Canada for the purpose of arranging for increased shipments from this country in future. Speaking of trade matters he said: "There is an unlimited market for Canadian lumber in England. We can use all you can send us, because we no longer cut hardwoods in England, and we have no soft woods. The factory laws now require that the floors be constructed of hardwood, in order to insure protection against fire, which has often been caused by splintered floors. English merchants are expecting to see a great development of the transportation facilities between Canada and the old land, and they hope that the proposed fast steamship line will soon be an accomplished fact. The British tradespeople have been very careless about their foreign commerce of late years, but they are now awakening to the fact that trade is slipping away from them. The imports of the United Kingdom have been increasing rapidly, while the exports have been decreasing. The merchants will in future seek further openings for their goods, in order to maintain their commercial supremacy over foreign competitors. British capital would be freely invested in Canada if the moneyed classes over there could be made to realize what a grand country this is. Money is cheap in the old country, but it will not be invested here until the financial pubic becomes satisfied of the safety of the field. English shareholders in colonial concerns have often been swindled, and do not show great anxiety to continue the experience."

* * *

In discussing the improvement in vessel freights this season as compared with recent years, a Canadian lumberman spoke as follows: "We are getting better freight rates now than have been paid in several years. The heavy demands of the iron and steel companies for ore has been a feature of the season, and a great drawback to the vessel owners in meeting this demand has been the contract made by American vessel owners early in the spring to carry ore from the head of the lakes throughout the season for 65 cents. The ruling price now is about an even dollar. This contract, of course, does not affect Canadian vessel owners, who are not greatly interested in the ore trade, except in the small business carried on between Lake Superior and Deseronto. We who are engaged in the lumber transportation business are beginning to realize the splendid effect of the government's regulations regarding the cutting of Canadian lumber in Ontario. Now any Canadian vessel can take a cargo from a Georgian Bay port to Buffalo, and the business is a new one for Canadian boats. Formerly the trade all went to United States bottoms trading between United States ports. The rates have also increased from 30 cents, which was paid on traffic to Georgian Bay last year, to 60 cents, which is paid this year. The lumber rate last year from Georgian Bay to Buffalo or Tonawanda was $1.25 per thousand, and it has grown to $2 already this season. The giving of this trade into the hands of Canadian owners has proved a great boon to us. Another cause to which I ascribe the demand for boats is that a large amount of tonnage left the lakes last season. Some thirty odd vessels, of an average of 2,000 tons capacity each, left the fresh water for the salt, and this reduced the local offerings of tonnage to quite a considerable extent. The boats having passed the rapids could not get back if they wished to."

## NEW HARDWOOD FIRM.

Messrs. Wm. Cooke, of St. Catharines, and A. A. Scott, of Toronto, have just formed a partnership and purchased the stave, heading and hoop mill of George Neibergall & Son at McGregor, Ont. The purchase embodies a large quantity of standing timber, including elm, basswood, white and red oak, sycamore, whitewood, birch and soft maple. It is said that this firm are now owners of more hardwood timber than any other firm in Western Ontario. They will manufacture all kinds of hardwood timber, staves, hoops and heading, and will export quite extensively to the British market. The mill is situated on two lines of railways, the Michigan Central and Detroit River and Lake Erie Railways, thus affording excellent shipping facilities. At present sixty hands are employed. Mr. Scott has removed his family to McGregor, where he will give his personal attention to the business. As both Mr. Cooke and Mr. Scott are practical men, we bespeak for the new firm a prosperous career.

ADVERTISING RATES FURNISHED ON APPLICATION

THE CANADA LUMBERMAN is published in the interests of the lumber trade and allied industries throughout the Dominion, being the only representative in Canada of this foremost branch of the commerce of this country. It aims at giving full and timely information on all subjects touching these interests, discussing these topics editorially and inviting free discussion by others.

Especial pains are taken to secure the latest and most trustworthy market quotations from various points throughout the world, so as to afford to the trade in Canada information on which it can rely in its operations.

Special correspondents in localities of importance present an accurate report not only of prices and the condition of the market, but also of other matters specially interesting to our readers. But correspondence is not only welcome, but is invited from all who have any information to communicate or subjects to discuss relating to the trade or in any way affecting it. Even when we may not be able to agree with the writers we will give them a fair opportunity for free discussion as the best means of eliciting the tr Any items of interest are particularly requested, for even if not of great importance individually they contribute to a fund of information from which general results are obtained.

Advertisers will receive careful attention and liberal treatment. We need not point out that for many the CANADA LUMBERMAN, with its special class of readers, is not only an exceptionally good medium for securing publicity, but is indispensable for those who would bring themselves before the notice of that class. Special attention is directed to "WANTED" and "FOR SALE" advertisements, which will be inserted in a conspicuous position at the uniform price of 15 cents per line for each insertion. Announcements of this character will be subject to a discount of 25 per cent. if ordered for four successive issues or longer.

Subscribers will find the small amount they pay for the CANADA LUMBERMAN quite insignificant as compared with its value to them. There is not an individual in the trade, or specially interested in it, who should not be on our list, thus obtaining the present benefit and aiding and encouraging us to render it even more complete.

## SENTIMENT ON THE LOG QUESTION.

There was a time in the history of Canada when the people were willing to give concessions to the United States for the privilege of marketing lumber in that country. They placed too low a price upon their forest wealth, and were satisfied to allow the timber to be cut down and taken to the United States for the building up of industries there, while at the same time paying a duty of one dollar per thousand feet on all Canadian lumber exported to that country. Later there came about a greater appreciation of the value of our timber possessions, and the people demanded nothing short of reciprocity in logs and lumber. This was not conceded, and consequently the exportation of logs from Ontario was prohibited. The result of the working of this restrictive clause has been to cause a new light to dawn upon the people of Canada, and to-day we find public sentiment strongly in favor of husbanding our timber resources and disallowing the exportation of logs and pulp wood under any conditions.

While twelve months ago the Lumbermen's Association unanimously declared itself in favor of reciprocity in forest products with the United States, we doubt if such a measure would now be favorably received, while the public generally are beyond question opposed to giving the Americans our timber at any price. Recent developments have shown that our timber products are wanted in nearly every part of the civilized world, that we are practically independent of the United States for a lumber market, and that there is a great future for the lumber trade of Canada. What the public desires is the establishment of box and door factories, planing mills, and other wood-working industries on the Georgian Bay and in other parts of the Dominion which will give employment to our people and result in building up a great commercial and manufacturing country. The growing feeling is that this can be accomplished only by husbanding our resources and protecting the interests of Canadian citizens.

The Michigan lumbermen who purchased timber limits in Ontario have filed a bill of damages against the Ontario government, claiming the sum of $936,500. The chief ground for the claim is the loss sustained by the compulsory shutting down of their mills in Michigan, by being deprived of the logs hitherto secured in Ontario under Crown license. The Ontario government have granted to these lumbermen permission to sue for damages, and the decision of the courts will be awaited with much interest. Should it be decided that these lumbermen are entitled to be recompensed on account of the position in which they have been placed by the Ontario legislation, we believe the people will back up the government in paying the amount of damages fixed upon, rather than submit to the removal of the manufacturing clause.

Our contemporary, the American Lumberman, does not seem to be well versed on the various stages of the Canadian-American situation with respect to the exportation of logs. That journal maintains that the manufacturing clause was omitted from the regulations governing the sale of Ontario limits in the year 1892 with a view to encouraging competition from Michigan lumbermen, and in the hope of obtaining higher prices for the limits. Having disposed of the limits without any restriction as to where the timber should be manufactured, the editor claims that the government of Ontario has now violated the contract. We would ask our contemporary to study the exact facts. In the summer of 1890 the Ontario government held a sale of timber limits, the regulations of which contained the manufacturing clause. In the fall of the same year the Blaine-Macdonald agreement was signed on behalf of the governments of the two countries, by which the duty on Canadian lumber was reduced from two dollars to one dollar per thousand in exchange for the abolition by Canada of the export duty on logs. It will thus be seen that before the sale of 1892, at which the Michigan lumbermen purchased large tracts of timber limits, the question of the exportation of the logs had already been settled. The above conditions remained until 1894, when lumber was declared free by the Wilson Bill. In 1897 the Dingley Bill restored the duty on all kinds of lumber to two dollars, thus violating the agreement which had been entered into between the two countries. Anticipating that the Dominion government would take steps to place Canadian owners of timber limits on an equal footing with American owners, the United States government sought to prevent this by placing in the Dingley Bill what is known as the retaliatory clause, with which our readers are familiar. This barrier was effectually overcome by the legislation of the Ontario government.

No further arguments are necessary to convince any intelligent person that the violation of contract was on the part of the United States government, and not the Dominion or Ontario governments. It is to the United States Congress that the Michigan lumbermen who feel aggrieved should look for redress, as through its action they find themselves in their present position.

## THE CANADIAN FORESTRY EXHIBIT AT PARIS.

THOUGH less than one thousand square feet of space has been allotted to Canada at the Paris Exposition, we understand that well-directed steps are being taken to make the Canadian exhibit as complete and attractive as possible. Nearly every industry will be represented, but we are pleased to learn that it is the intention to give special attention to the forestry exhibit. In British Columbia, Manitoba, Ontario and Quebec the provincial governments have undertaken to collect the necessary specimens for a complete representation of the woods of these provinces, while the entire exhibit is under the supervision of an official of the Dominion government.

While all the usual features of such an exhibit will be retained—sections of trees, square timber, deals, pulp wood, etc.—it is understood that a special effort is being made to secure material which may lead to an extension of trade in lines now only partially developed, or to the opening up of new industries. That there is an extensive field for development in this direction is demonstrated almost daily by enquiries received by Canadian firms from European houses. To make this portion of the exhibit complete, the co-operation of those interested in the lumber business is essential, and it is hoped that manufacturers will accept this intimation and not wait for a personal solicitation before contributing to the exhibit. Material can only be procured from the manufacturers, and in some special lines those charged with the collection of specimens may have difficulty in informing themselves of the mills from which such material can be procured, or may indeed in some cases be quite ignorant of the existence of establishments manufacturing goods which would go a long way towards increasing the value and interest of the exhibit. This applies particularly to new methods of utilizing waste and small stuff from large saw mills, and to hardwoods, such as maple, birch, ash, basswood, etc. As the exhibit will include all such material as is shipped in a condition short of a completely manufactured article, hardwood specimens especially will be shown in a great variety of forms, although the bulk of the exhibit will, of course, consist of coniferous woods. No doubt pulp and products of pulp will form an interesting part of the display.

Ample wall space will, we understand, make it possible to show a large number of photographs illustrating lumbering operations in the woods, on the rivers, and at the mills. For these the government will be largely dependent upon those actively engaged in the business. These views will go far towards making the exhibit attractive, and will give it an individuality that would otherwise be lacking. The fine collection of photographs of native trees framed in their own woods which was sent by the Geological Survey to the World's Fair at Chicago will again be used, and

will be supplemented by photographs of exceptionally large trees if they can be procured.

The government will prepare a bulletin for distribution at the exhibition. This will contain information of interest to purchasers and consumers of forest products and to those who may contemplate investing capital in Canada. Much benefit is almost certain to accrue to Canada from a creditable display of native woods and products.

## CANADIAN LUMBER AND PULP.

Upon the return of commercial prosperity to Canada, after several years of depression and unprofitable trade, it is natural to give some thought to a study of the conditions existing in the lumber business and allied industries, and to the prospects for the future.

The present is a time when nearly all manufacturers find their accommodation and facilities taxed to the utmost to supply the demand for goods, and in many instances their capacity is being increased in order to handle the business in sight. In Western Canada building operations have been retarded by a scarcity of brick and other materials, while in Ontario and Quebec, where more structural iron and steel enter into the construction of buildings, great difficulty is being met with in obtaining the necessary supply. There is a veritable "boom," but one devoid of speculation and resulting largely from a growing development of our natural resources.

In what relation to this general improvement in commerce do we find the lumber trade? Reports from lumbermen in every section of the Dominion give a most decisive and satisfactory answer to this question. Of the many industries of the Dominion none have shown greater improvement within the past twelve months than that of lumber. It is not, perhaps, in a condition equally prosperous with some other lines of commerce, but it must be remembered that in the years of depression few other industries suffered to the same extent. The present healthy revival is the more remarkable in view of the discrimination against Canadian lumber shipped to the United States. Any lumber thus shut out of that country has been marketed locally or in other foreign countries, and at prices which have netted more to the manufacturer than when there was free lumber.

Without being too optimistic, we venture the opinion that the future of Canada as a timber supplying country is one of the brightest. No one who gives the question any consideration can but fail to arrive at the conclusion that our timber resources are bound to go a long way towards making us a great manufacturing nation. True, we have always possessed the timber, but it is in the evidences of development that we find encouragement and ground for our contentions.

We believe that more British timber merchants have this year visited Canada than ever before. They have come solely with the object of acquainting themselves with the manufacturing methods in vogue in this country, and of increasing, if possible, their purchases of Canadian timber products. They have met the Canadian manufacturers more than half way, and have given them every encouragement and assistance looking to the extension of trade with the mother country. There is an almost incredible desire on the part of European importers and manufacturing firms to learn more of the Canadian trade, apparently due to some extent to a feeling in favor of trading with a British colony. As an illustration, we might point to the large number of foreign merchants who have recently became subscribers to this journal.

The future of the pulp industry is quite as promising as that of lumber; in some respects the outlook is even more hopeful, inasmuch as no other country in the world possesses such an abundance of raw material and suitable water powers for the manufacture of pulp. These advantages are gradually becoming recognized, and foreign capitalists are showing more faith in Canadian enterprises.

Just how many pulp mill projects are under way and contemplated in Canada at the present time it is difficult to say. We should judge that there are more than a dozen that are likely to be carried out immediately, including those at Keewatin, Hawkesbury, Sturgeon Falls and Frankford, in Ontario; at Shawenegan, Calumet, Dufferin Falls and the Lake St. John district, in Quebec; at Tobique Narrows, Salmon River and Mispec, in New Brunswick. Some of these enterprises are very extensive in character, involving an expenditure of over one million dollars.

It is with pleasure that we learn of a contemplated visit to Canada next month of a number of the leading British paper makers for the purpose of inspecting our pulp mills. The tour is to last one month, and arrangements are being made to entertain the party in a royal manner. The suggestion has been made that the provincial governments should assist in entertaining our British friends by giving excursions through some of the best spruce belts. The opportunity is one which should not be allowed to pass unimproved. That it would be of advantage to the province is certain.

The growth of the pulp wood industry is said to be enhancing the value of spruce lands. When we consider the recent purchase by Mr. Lionais of pulp wood property in Quebec, valued at over one and three-quarter million dollars, this is not to be wondered at.

## WOOD PULP IN FRANCE.

The importation of wood pulp into France continues to increase, though not at a very great rate. The latest figures available are those for the four months ended April 30 last, and for that period the importations of mechanical pulp into France reached a total of 27,980 1/5 tons, as compared with 27,124 9/10 tons in the same period of last year, and 20,293½ tons in the first four months of 1897. The import of chemical pulp is just about half that of the mechanical sorts, reaching, in the period under notice, 14,125 4/5 tons, against 13,265 tons last year, and 12,589 1/5 tons in 1897. The exportation of pulp is comparatively trifling, only amounting in the four months of this year to 157 1/10 tons of mechanical and 100 4/5 tons of chemical; in 1898 the figures were, mechanical, 10 3/5 tons; chemical, 168 9/10 tons; and in 1897, mechanical, 67 3/10 tons; chemical, 126 1/10 tons.

Seasoning timber by electricity promises wonderful results. It is claimed that twenty-five cubic feet can be treated at the cost of only one cent. Timber thus treated will not absorb dampness and does not decay. The treatment requires only from five to eight hours.

## THE LATE HON. WM. B. IVES.

Hon. W. B. Ives, M. P. for Sherbrooke, Que., breathed his last in St. Luke's Hospital in Ottawa on July 25th, death resulting from hemorrage of the brain. Deceased was born in the township of Compton, Que., on Nov. 17, 1841. His parents came to Stanstead from Connecticut, and were among the first settlers at Lake Memphremagog. He was educated at Compton Academy, and in 1857 was called to the bar. For many years Mr. Ives successfully practised his profession, and in 1880 was created a Q.C. In 1869 he married Elizabeth E., only daughter of the late Hon. J. H. Pope, Minister of Railways and Canals under Sir John Macdonald. In addition to the pursuit of law, Mr. Ives largely interested himself in railway building and in manufacturing. He was one of the principal proprietors of the Cookshire Mill Company, president of the Hereford Railway Company, of the Royal Pulp and Paper Company, of the Salmon River Pulp Company, and of the Scots-

The Late Hon. Wm. B. Ives.

town Lumber Company, and vice-president of the Dominion Cattle Company.

Mr. Ives also devoted much attention to politics, and, after having been mayor of Sherbrooke, was elected as a Conservative to the House of Commons for Richmond and Wolfe at the general election in 1878. He continued to hold that seat up to the general election of 1891, when he was chosen as member for Sherbrooke, which he represented up to the time of his death. On December 5, 1892, he entered the government as President of the Privy Council. In December, 1894, he was appointed Minister of Trade and Commerce, and continued to hold that portfolio until the defeat of the Conservative party in 1896. Mr. Ives was one of the seven members who resigned from the government of Sir Mackenzie Bowell.

The Wm. Hamilton Mfg. Co., of Peterboro, Ont., have recently remodelled and increased their office accommodation. New hardwood floors have been laid, the wainscoting grained and varnished, walls and ceilings papered, and a new staircase put in to reach the upper floors and draughting rooms. The company are experiencing a large demand for their various lines of machinery.

## NOTHING MORE IMPORTANT THAN PULLEYS.

There is nothing more important that is used around the mill than the pulleys, and yet how few people pay any attention to them, says a correspondent of the St. Louis Lumberman. A wagon without a wheel is of no use, and a machine without a pulley would stand in the same light. A man buying a machine will pay considerable attention to the make of the machine, to the size of the journals, the spindles, and its weight, and yet pay no attention at all to the pulleys—really the most important part of the machine.

Within the last thirty years wonderful strides have been made in the improvements of our wood working machines, yet no change in the pulley. Science and high degree of mechanical engineering have been brought into play to develop the machine to the highest degree, but when they came to the pulley—their science and skill suddenly cease and the same old pulley is adopted. In saw mills the change all through the machine is apparent. The mandrel is much larger, the journals are larger, the frame is heavier, but the size of the pulley remains the same. On engines the shaft is much larger, the wristpin is larger, the working parts are heavier throughout, but the old-style pulley is the same.

There has probably been more change and improvement in our planing mill machines than any others, but look at the pulleys. The same remark is applicable to gang edgers. Look at these machines and compare them with the edger of twenty-five years ago. At that time the idea of making railroad ties on an edger would have seemed preposterous, but to-day it is a common thing to see 4-inch to 6-inch cants run through gang edgers and heavy dimension made to save time with the big saw, yet the pulleys are the same size practically. The necessity of enlarging the pulley seems to have been overlooked or ignored. Some manufacturers seem to think that if they adopt large pulleys, people will not buy their machines. They overlook the fact that a large pulley enables a machine to do more work, as much so as any other heavy part of the machine.

To the practical mechanic or mill man a large pulley is, or should be, as much of a recommendation to the machine as a large journal or spindle. If the builders of the heavy, massive machines of to-day were to put a little less metal in their frames and a little more in the pulleys that go with the machine, the results would be better and the purchaser benefitted. There is not a planing machine built in the United States but what comes out with pulleys that are too small. Take the heavy dimension planer that dresses a stick 18 inches thick by 30 inches wide on all four sides at one operation. The pulleys are 6 x 6 on the cylinders and 5 x 5 on the matcher heads. Does any sane man doubt that the machine would do the work easier if the pulleys were at least three-fourths larger, not only in diameter, but in the face? Take the 4, 5 and 6-saw gang edgers; if their pulleys were 24-inch diameter instead of 14-inch, would they not do the work better? Would it not be easier on the belts?

On the saw mills of to-day, where in this country the saw is running on from 10 to 24-inch feed, would it not be better if the pulleys were 36 or 40 inches than 26 to 30? Some one may ask, where is the advantage and economy of the large pulley over the small one? The pulley bears the relation to the machine of a lever, and the larger the diameter of the pulley the greater the leverage. The longer the lever the easier it is to turn over the weight. Take a pulley 12 inches in diameter. One-half its circumference is 18 inches, which represents the surface to be gripped by the belt. Take another pulley 24 inches in diameter. One-half its circumference is 36 inches, which represents the surface to be gripped by the belt. Does it require any special amount of common sense to see that the belt will slip less on the big pulley than it will on the small one? And, slipping less, will not the belt last longer? The belt is benefitted in three ways by the larger pulley. First, it will slip less, it can be run slacker, and less weight is needed in the tightener, where one is used, to make the belt hug the pulley. The saving in belting alone is enough to recommend the large pulley. The saving of time, by belts not breaking, and the saving of vexation of spirit, are also obtained in this way.

If our planers were fitted with pulleys on the spindles 10 or 12 inches in diameter and 9 or 10-inch face, will any one say the belts would not last longer? Some may say that you would have more belt travel. Very true; but a belt, like an engine, will travel at a high rate of speed under proper conditions better than it will at a slow speed under improper conditions. The manufacturer of planers, gang edgers and other machines who will step out of the old rut and adopt larger pulleys on his machines will soon be regarded by the users of machinery as a public benefactor. In my acquaintance among the mill men I know one man only who, when he buys a machine, discards the small pulleys and puts on others that are larger in every way. This man uses a lower grade of belting in consequence, is never annoyed by belts breaking and never kicks about his belts being no account. He never "cusses" the belt drummer and says those belts "did not come up to the guarantee." He fixes his machines up in a business way and then the machines go ahead and attend to business.

The use of the large pulley over the small one is based on all the rules of theory and practice. I hope the thoughtful mill man and the thoughtful mechanic will look into this matter and at least give it a trial before condemning it and frowning it down.

## AN EXHIBITION OF AXES AND SAWS.

A TEST of axes and saws is to be held at Ulverston, a small town in Tasmania, under the auspices of the United Australian Axemen's Association, on November 20th, 1899.

British makers have for some time complained of the preference shown for United States saws and axes, so it has been decided, at the gathering this year of sawyers and axemen of Australia, to hold a contest, open to all British and American, and possibly Swedish and German saws and axes, and to all Australasian sawyers and axemen. The committee in charge of the trial will include Hon. Sir Edward Braddon, Prime Minister of Tasmania, and other gentlemen of standing. This should prove a valuable opportunity for opening up an export trade in Canadian products, if they are of as good quality as we believe them to be.

## THE FORESTRY LAWS OF INDIANA.

A STATUTE for the encouragement of forestry passed by the State of Indiana this year provides that any person may select from land owned by him a portion not exceeding one-eighth of the entire tract. The portion so selected may be original forest, and if upon each acre of this portion there are maintained not less than 170 growing trees, the law provides that it shall thenceforth be assessed at $1 per acre at the end of three years, if the owner plants 170 trees per acre and cultivates and maintains the same for that period. If the tract selected has a number of original forest trees growing upon it, but less than 170 to the acre, it may be brought within the act by planting a sufficient number to make up the 170 to the acre. In case any trees are removed or die, the owner, in order to avail himself of the act, is required to plant other trees to take their place, and to protect them until they are at least four inches in diameter. The act further provides that no land owner who shall permit cattle, horses, sheep, hogs or goats to pasture on the reservation before the trees are four inches in diameter shall receive the benefit of it. Before the land is specially rated as forest land the owner has to file a statement with the municipal authorities showing what portion of his land he selects for the purposes of the act. The assessor is required to personally examine the various reservations, and to note upon his return the condition of the trees.

The act of the Indiana legislature shows the growing public appreciation of the importance of forest preservation.

## THE HARDWOOD TRADE IN FRANCE.

Referring to the import of hardwood lumber into France, a United States Consul says: "Most of the trade in hardwood lumber products is done by English houses. Of course, the product originally comes from American mills. Wagons, spokes, and handles, and all turned goods in this district are, I think, imported from England, though the wood itself is mostly of American origin. Whether it would pay to seek to get this trade direct is a question which can only be determined by months of careful study on the part of one thoroughly familiar with every branch of the business. Thongh I have been a manufacturer in this line, and have consequently a particular inclination to the study of conditions affecting this trade, I should hesitate to advise any manufacturer to enter this field without some months of careful study of actual conditions, not of the market merely, but of the ultimate consumption. Judging from what I have learned, I should doubt the policy of competing with the English trade, which is carried on by customers of American producers." We trust this excellent advice will be followed.

An English syndicate, represented in New Brunswick by Fred. H. Hale, M.P., and George S. Murchie, purpose erecting a mammoth saw mill on the Tobique river. The promoters have been in negotiation with the Canadian Pacific Railway with a view to getting a low freight rate to St. Andrews, from whence it is proposed to ship the lumber. At last account it seemed probable that a favorable rate would be granted.

# CANADA LUMBERMAN

## WEEKLY EDITION

The Lumberman Monthly Edition, 20 pages } $1.00 PER YEAR { The Lumberman Weekly Edition, every Wednesday

*THIS PAPER REACHES REGULARLY THE PRINCIPAL LUMBER MANUFACTURERS AND DEALERS THROUGHOUT CANADA, AND WHOLESALE BUYERS IN GREAT BRITAIN, THE UNITED STATES AND OTHER FOREIGN MARKETS.*

VOL. V. TORONTO, ONT., JULY 26, 1899 No. 27.

## CANADA LUMBERMAN

PUBLISHED BY

**The G. H. Mortimer Publishing Co'y of Toronto, Limited**

*Confederation Life Building - TORONTO.*

Branch Office:
NEW YORK LIFE INSURANCE BUILDING, MONTREAL.

**Weekly Lumberman,** published every Wednesday. Contains reliable and up-to-date market conditions and tendencies in the principal manufacturing districts and leading domestic and foreign wholesale markets. A weekly medium of information and communication between Canadian timber and lumber manufacturers and exporters and the purchasers of timber products at home and abroad.

**Lumberman,** Monthly. A 20-page journal, discussing fully and impartially subjects pertinent to the lumber and wood-working industries. Contains interviews with prominent members of the trade, and character sketches and portraits of leading lumbermen. Its special articles on technical and mechanical subjects are especially valuable to saw mill and planing mill men and manufacturers of lumber products.

☞ Subscription price for the two editions for one year, $1.00.

## WANTED AND FOR SALE

Advertisements will be inserted in this department at the rate of 15 cents per line each insertion. When four or more consecutive insertions are ordered a discount of 25 per cent. will be allowed. This notice shows the width of the line and is set in Nonpareil type; 12 lines make one inch. Advertisements must be received not later than 4 o'clock p.m. on Tuesday to insure insertion in the current week's issue.

HAVE YOU ANY STOCK WHICH YOU WISH to sell? If so, make the fact known to probable buyers by placing an advertisement in this department. Address, CANADA LUMBERMAN, Toronto.

FOR SALE.

COMPLETE SAW MILL MACHINERY, PLANing, Sash and Door Machinery; modern and in good condition Can be seen at Toronto. Apply PETER RYAN, Toronto.

**PINE FOR SALE.**

45 M FT. GOOD PINE LUMBER, 12 and 14 ft. long, 2, 1½, 1¼ and 1 in. thick—sawn in May. At Baird's Mill, five miles from Markdale. J. RITCHIE, Glascott, Ont.

LUMBER FOR SALE.

60 M FEET IN. BASSWOOD; 10 M FEET 1 in. Ash; 60 M feet 1, 2 and 3 in Birch; 5 M feet Maple. Mill run on cars at Huntsville. S. H. JACOBS, Huntsville, Ont.

**RAILWAY TIES FOR SALE**

25,000 CYPRESS TIES, DELIVERED AT Murray Bay or Quebec. For particulars apply to LECLERC & LETELLIER, 104 and 106 St. Paul Street, Quebec.

WANTED—DRY BASSWOOD.

DRESSED TWO SIDES TO ⅜ THICK, CUT to dimension sizes. for export. This will prove an excellent outlet for common and cull basswood. Elm Strips, Rock Elm or Soft Elm (latter preferred) Strips, 1½×2, 1½×1, and ½×1; all lengths 6 ft. and up—Car-loads for export. For full particulars, address "EXPORTERS," P.O. Box 1040, New York City.

**FOR SALE**

A FIRST-CLASS LUMBER AND SHINGLE Mill, average capacity per day 35 M. feet lumber, 70 M. shingles, and 15 M. lath; situated in Huntsville, close to the G. T. R. station, with sidings to mill; plenty of virgin pine. Also a first-class site for a tannery, plenty of tan bark. Will be sold at a bargain. Apply to T. WHALEY, Huntsville, Ont.

## AUCTION SALE, SEPTEMBER 7TH, 1899

Will be sold at Auction, by order of the Supreme Court, under the direction of Austin B. Fletcher, Esq., Receiver, on Depot Square, at White Plains, N.Y., on THURSDAY, SEPTEMBER 7TH, 1899, at 11:30 a.m., the Lumber and Coal Yard formerly owned by the John W. Young & Sons Company, at White Plains, N.Y., the County Seat of Westchester County. Population 8,000 to 10,000, on the line of the New York & Harlem Railroad, 22 miles from Grand Central Depot, New York City.

**Two-Storey Frame Office Building, Iron Clad Elevator (capacity 35,000 bushels), Large Brick and Frame Planing Mill and Wood-Worker, ample Coal and Lumber Sheds, abundant Trackage, Wagon and Track Scales, located on two sides of the Square at the Station. Will be offered in parcels and as a whole.**

Also, at the same time and place and under the same order, the Lumber and Coal yard lately owned by the same Company, situate at the Station at Tuckahoe, also on the New York & Harlem Railroad, 16 miles from Grand Central Depot. A smaller yard than the former, but very complete in its appointments; Office Building, Coal and Lumber Sheds, comparatively new, in good order; side track, scales, etc.

**Two grand opportunities for a live man. For maps giving full particulars, terms of sale, etc., apply to**

**AUSTIN B. FLETCHER, Receiver, 32 Liberty St., New York City.** or **W. B. TIBBITS, Auctioneer, White Plains, N.Y.**

# Sale of Timber Licenses

## PROVINCE OF NEW BRUNSWICK

There will be sold at Public Auction, at the Crown Land Office, Fredericton, on

**WEDNESDAY, 30TH AUGUST, A.D., 1899,**

and following days, the vacant unlicensed Crown Lands in the Province of New Brunswick.

573 berths will be offered, ranging from 2 to 10 square miles each. Upset price $8.00 per square mile.

The present regulations provide for licenses to be renewed each year for a period of 18 years from 1st August, 1900, at a rate of $4.00 per square mile, in addition to stumpage.

Further information of Sale can be obtained from Crown Land Office, Fredericton, N B.

A. T. DUNN,
Surveyor General.

SAW MILL FOR SALE.

THIRTY-FIVE HUNDRED DOLLARS BUYS Saw mill worth double this amount, if taken at once; 2 Boilers 120 h.p., Engine 100 h.p., Iron Saw Frame, Three Block Carriage, 2 good Saws, Double Edger and Trimmer good as new, Slash Chain, all in good running order, run this season; size of Mill, 30×100 ft.; good Boiler House, Blacksmith Shop, House, Barn, etc.; 400 acres of good Birch and Hemlock, also thousands of acres of timber near by. For particulars, address ALLEN CRESSMAN, Berlin, Ont.

### CURRENT TRADE CONDITIONS.

ONTARIO.

Lumbermen in Ontario are much encouraged by the inquiries for stock that have been received from all quarters. It is believed that when the mills shall close down for the season there will be very little unsold stock in the yards, and dealers who do not secure their winter supply during the next couple of months will in all probability be obliged to pay higher prices, and they may find it impossible to obtain stock at any price. A correspondent in the Georgian Bay district writes that the present activity in trade has not been equalled for many years. Mill culls which two years ago sold at $5 per thousand now meet with a ready sale at an advance of $2.50 upon that figure, and none of the manufacturers have any large stock for sale. The lumbermen are already giving some attention to preparing for operations in the woods next winter. It is hoped that manufacturers will exercise precaution and restrict the log production. Although the market is strong, it would be a mistake to increase the production to any extent. The policy of each manufacturer should be to cut an average stock and obtain for it a remunerative price.

QUEBEC AND NEW BRUNSWICK.

In another column will be found a statement of timber measured at Quebec up to 25th July for three years, by which it will be observed that the receipts of waney white pine this year are about the same as last season, while square pine shows a large decrease. There has also been a slight decrease in the receipts of red pine and an increase in birch and maple. Nothing has transpired within the past week to cause the market to fluctuate, and prices generally are steady, with a moderate demand. The proposed harbor works at Montreal will require a large quantity of timber. Although the government has only granted $750,000 for these works, it is expected that over $2,000,000 will be expended before they are completed. The local demand for lumber is being restricted on account of the scarcity of structural iron, as work on large buildings has been suspended until next season.

Foreign trade is active and many vessels are loading.

Favorable reports continue to be received from New Brunswick and Nova Scotia, where much of this season's cut of deals has been contracted for. New Brunswick cedar shingles are stiffening in price. Some of the mills are said to be asking $3.20 and $3.25 for extras, $2.75 and $2.80 for clears, and $2.40 to $2.50 for second clears. Even at these prices many of the yards are still in want of shingles, as the mills have contracts in advance and are unable to fill new orders.

UNITED STATES.

Reports from every section of the United States are peculiarly unanimous as to the strength of the lumber market. Some of the northern operators are declining to consider orders for a time, having more business than they can properly look after. Although prices usually weaken during the months of July and August, this year the reverse has been experienced. Minneapolis manufacturers have just made an advance of 50 cents per thousand on lumber and 25 cents on lath, and a further advance is said to be very probable. In Chicago, short piece stuff is selling from the yards at $14, while a few years ago from $9 to $10 was about the average price. Eastern wholesale dealers report numerous orders which they are unable to fill on account of scarcity of stock. At Buffalo practically all stocks are low, and particularly low grade cutting-up pine. Box makers are using Norway to make up for the scarcity of white pine.

No material change has taken place in the spruce market. A meeting of manufacturers was held at Boston last week, at which an advance in prices was discussed, but beyond adopting more stringent terms of payment, no action was taken.

The hardwood situation has not been relieved to any extent. Stock is moving, from the mills as fast as manufactured, and dealers are unable to stock up in preparation for the fall trade. There is a brisk demand for all sorts of shingles and lath, the latter especially being very scarce. The prices adopted at Buffalo will be found elsewhere.

FOREIGN.

The general tone of the British trade is good. Building work is proceeding with unusual briskness, and there is a heavy retail demand for sawn and planed lumber. Merchants have so little stock to offer f.o.b. that few of them can quote prices. A writer in the Timber Trades Journal remarks that he never recollects a similar state of the market, and the general opinion is that next year prices will be even stronger than at present. The difficulty of getting good 3×9 and 11 inch Baltic deals is assisting the pine and spruce market.

The official returns published by the Board of Trade present some interesting figures. During the six months ending June 30th this year, the quantity of sawn and hewn wood goods imported into Great Britain was in excess of that of last year by 1,460,213 loads, valued at $1,825,889. From Canada there was imported during this period 368,611 loads of sawn timber and 25,744 loads of hewn timber, against 222,850 and 14,490 loads respectively in the first six months of last year. The total from all countries this year was 3,987,693 loads. Notwithstanding this heavy import, the stocks on hand at the present time are little in excess of those held at the same time last year, which shows the great volume of consumption.

In France trade is also active, goods having been sold during the past month at prices which have not been equalled in the memory of those engaged in the trade.

STOCKS AND PRICES.

John Dewar & Sons, of St. George, N. B., have loaded eleven vessels with lumber this season.

W. T. Quickfall, of Glen Allan, Ont., has just shipped a car-load of basswood lumber to Havre, France.

It is the intention of Alger, Smith & Company to continue operations next winter on their Pigeon river limits.

The Huntsville Lumber Co. have purchased from J. J. Long, of Collingwood, berth No. 8, Finlayson, paying $74,500 for the limits.

On July 14th the spruce manufacturers met at Boston and advanced the price of lath ten cents, making prices $2.35 for 1½ in., and $2.50 for 1⅝ in.

The Mikado Gold Mining Co., of Rat Portage, Ont., wants tenders for the delivery before the close of navigation of 2,500 cords of tamarac and jack pine cord wood.

A report from Quebec states that owing to the carrying away of bridges and the breaking of booms at St. Joseph and St. Francois, 900 cords of pulpwood are adrift.

G. O. Buchanan, of Kaslo, B. C., purposes establishing a saw mill at Duncan City. He has been given a contract to cut 2,000,000 of bridge timber for bridges along the Kaslo and Slocan railway.

Howard & Craig, of Sherbrooke, Que., have recently purchased 6,000 acres of choice timber lands in the counties of Beauce and Dorchester. The timber will be floated down the Chaudiere river to their mill at Beauce Junction.

The steamship Laburn cleared from Parrsboro, N. S., on July 17th for Manchester, with 3,447,496 feet of deals, ends and scantlings, shipped by M. L. Tucker for W. M. Mackay. This is the largest cargo of lumber ever shipped from Nova Scotia.

At Boston brown ash of the better grade is in good demand, and the supply is practically nil. Firsts and seconds bring $38 to $40. Very little thick elm is offered, and 3-inch is particularly scarce. 1-inch is quoted at $28 to $30, and thicker at $32 to $33.

There is an extraordinary demand in Michigan for cedar. It is almost impossible to get hold of the stock, in spite of the largest output last winter ever known, and prices have nearly doubled. The telegraph and telephone companies are using it in large quantities.

The steamer Morven sailed from Montreal on Saturday last for Glasgow, having on board 1,617 standards of deals and timber, consigned by McLean, Kennedy & Co. The steamship Hildawell is loading a cargo of timber and deals for U. K. on account of same firm.

Since last report the following rafts have been entered at the office of the Supervisor of Cullers, Quebec: By McArthur Bros., oak, pine, ash, etc., at New Liverpool Cove; Gillies Bros Co., square and waney pine, at Bridgewater Cove; McLeod & McNeil, waney pine, at Sharples Cove; James McBurney & Co., waney pine, at Upper Sillery.

In other seasons, considerable business has been done in Northern Wisconsin in the sawing of deals for export to Great Britain, but there has nothing whatever been done in white pine deals this season. The only transaction on foreign account has been 600,000 feet of Norway, which was cut to specified dimensions for a Canadian concern on Liverpool account. This is due to the prosperous domestic trade.

Shipments of lumber from St. John, N.B., to the United Kingdom and continent during the first six months of 1898 aggregated about 46,000,000 feet of spruce and 451,000 feet of birch. During the same months of this year, the spruce shipped to the United Kingdom alone amounted to 67,762,544 feet, and the birch to 2,603,674 feet.

Following is a comparative statement of timber, &c., measured and culled at Quebec to July 25th, 1899:

| | 1897. | 1898. | 1899. |
|---|---|---|---|
| Waney white pine, cu. feet. | 1,710,512 | 1,100,134 | 1,168,534 |
| Square white pine, cu. feet. | 447,653 | 750,720 | 276,935 |
| Red pine, cu feet | 107,188 | 133,329 | 88,351 |
| Oak, cu. feet | 1,038,466 | 589,401 | 429,559 |
| Elm, cu. feet | 479,841 | 345,487 | 475,824 |
| Ash, cu. feet | 86,085 | 25,826 | 54,146 |
| Basswood, cu. feet | 15 | | |
| Butternut, cu. feet | 673 | 795 | 60 |
| Birch and Maple, cu. feet. | 183,093 | 106,480 | 231,575 |
| Tamarac | | | 415 |

At a recent sale held by Churchill & Sim, London, Eng., Canadian goods sold as follows: 12-13 ft., 3 x 9 fourth quality pine, £6 15s; 9 11 ft., 3 x 9, £6 5s; 12-16 ft., 1½ x 10, first quality pine, $18; 12-16 ft., 1½ x 10-20, £17 10s; 12-16 ft., 1½ x 9, £17 15s; 16 ft., 1½ x 8, £17 5s. 12-13 ft., 3 x 11 third quality spruce, £7 15s; 8-13 ft., 2 x 4 assorted spruce, £7; 13 ft., 3 x 9, third quality, £8; 9 17 ft., 3 x 11, second quality, £9 15s.

The Saginaw Lumber & Salt Company, of Saginaw, Mich., last week sold 800,000 feet of box lumber at $13.50, which is the highest price at which box has yet been sold. Two years ago $9 would have been regarded as a high price for the same grade of lumber. Generally, box is quoted at $12 and $12.50. Log run is worth $15 to $17 for Canadian stock, and $16 to $22 for Michigan stock, according to quality. Norway is held at $9.50 and higher, and mill culls at $8 to $10.

A sale of dry stock was recently made at Duluth, Minn., which shows the extreme prices paid for lumber at the head of the lakes. The prices were as follows: 4 to 10 in. No. 2 common, $12.50; 12 in. and up, $13; 4 to 10 in. No. 1 common, $15; 12 in. and wider, $18; 4 in. and up No. 4 boards, $8.75—in all about 4,000,000 feet, besides which there was a lot of No. 4 boards in another sale at $9. In January last several firms sold their No. 4 boards at $6.50, and a bill of stuff sold in March this year showed as follows: 12 in. and wider No. 1, $16.50; 10 in., $14.25; 8 in., $13.50; 6 in., $14.25; 4 in., $12.50; No. 2, 12 in. and wider, $12; 10 in., $12.50; 8 in., $9.75; 6 in., $10.50; 4 in., $4.50.

The Liverpool correspondent of the Timber Trades Journal, referring to the pine and spruce market, says: Perhaps the weakest item in Quebec goods is still pine deals, boards, sidings, strips, and similar forms of partly-manufactured pine goods. The demand of last winter was not sufficiently large to make any notable impression upon the stock left over from the 1898 season. These now figure in the Liverpool stock at 15,649 standards, against 11,020 standards in 1898, and 5,834 in 1897. With such a load as this to carry, the market is feeling the effects of the overweight. Spruce deals continue on their upward move, and now shippers are not only asking 2s 6d to 5s per standard more, but are even indifferent sellers at this advance. It is the smaller ports round the coast where the pinch is felt more severely, for the great difficulty is now to secure small sailing vessels of 250 to 300 standards' capacity. The large centres of the trade, which can accommodate steamers of 1,500 to 1,750 standards, do not suffer in the same manner.

The saw mill of Richard Kirton at Grenville, near Newmarket, Ont., was burned recently, together with 20,000 feet of lumber. The damage is $1,500, with no insurance.

WANTED

Rock Elm, cut to order.
Soft Elm, all thicknesses.
Black Ash, all thicknesses.

State quantity you can supply, with lowest prices.

### BUFFALO PRICES.

The trade at Buffalo and Tonawanda have adopted the following price list on shingles and lath :

Michigan white pine shingles—18 in. XXXX, $3.70; 18 in. C.B., $2.85; 18 in. sound butt, $1.50; 16 in. XXXX, $3.25; 16 in. extra A, $2.65; 16 in. A, $2.40; 16 in. C.B., $2.35; 16 in. 6 in. sappy C.B., $2; 16 in. sound butts, $1.50; 16 in. culls, $1.25.

Michigan white cedar shingles—18 in. XXXX, $3.40; 18 in. C.B., $2.55; 16 in. XXXX, $2.80; 16 in. extra A, $2.40; 16 in. A, $2.12½; 16 in. C.B., $1.90, 16 in. cull, $1.25.

White pine lath—1 x 1½ in. No. 1, $2.50; No. 2, $2.15; 1 in. No. 1, $2.50.

Norway lath—1 x ½ in. No. 1, $2.25; 1 x ½ in. mixed, $2.35.

Red cedar shingles are quoted by Haines & Company at $3.50 for 18 in. perfection, $3 for 16 in. extra clears, and $2.60 for extra A's.

### THE BARBADOS MARKET.

From circulars just to hand we obtain the following particulars of the Barbados lumber market :

On June 30th the schooner Mignonette arrived from St. John, N.B., with 49 M feet shipping white pine boards and planks. The boards were sold at $23.60 and the planks at $22.60. She also had on board 38 M feet second quality boards, sold at $17.60, and 5 M feet narrow spruce, which sold at $14.10. The steamship Taymouth Castle, from St. John, N. B., brought 242 M long cedar shingles, which sold at $3.26, and a smaller lot, which sold at $3. The cargo of the Herbert Rice, from Meteghan, N.S., which arrived on same date, had 146 M feet spruce lumber, sold at $17.15, and 48 M spruce laying shingles, sold at $2.11. The Alliance arrived from Gaspe, Que., with 127 M shingles, principally spruce laying, which had not been sold at last report. The demand for both lumber and shingles is good.

### SHIPPING MATTERS.

The recent advanced ideas of steamship owners is having more or less of a tendency to retard business, temporarily at least. Tonnage ings, however, continue limited, and with quite a number of vessels wanted for late July and August loading. The situation naturally favors vessels. Grain rates are fully sustained on a moderate volume of business. There has been little done in timber and deals, but tonnage is wanted and shippers show a willingness to pay an advance over recent fixtures.

From St. John, N.B., we learn of the following fixtures : Bark Bristol, West Bay, N. S., to w. c. England, deals, 51s; ship Savona, Grindstone Island, Que., to w. c. England, deals, 47s, birch, 50s; str. Vinermia, 1,745 tons, West Bay, N. S., to w. c. England, 48s 9d; str. Towhatan, 1,640 tons, St. John, N. B., to Liverpool or Birkenhead, 48s 6d; bark Alert, Hillsboro, N. B., to U. K., deals, 50s; str. Aldersgate, St. John to w. c. England, 48s 9d.

The Timber Trades Journal reports the following fixtures : Matane, Saguenay or St. Thomas, sailers to U. K.. 40s; Grindstone Island, Que., to w. c. Great Britain, 600 tons, 52s 6d, August; Miramichi to w. c. England, 1,250 stds., 48s 9d, August, 1,200 stds., with 100 stds. birch, 48s 9d; Miramichi to London, deals and birch timber, 800 stds., 52s 6d, August; St. John to Liverpool, 1,850 stds., deals, 41s 6d, and some birch logs at 17s 6d per load.

The sash and door factory of J & P. Nadeau at Grand Cascapedia, Que., was destroyed by fire last week.

### CANADA'S GREATEST FAIR.

This year will mark the coming of age of Canada's Great Fair and Industrial Exposition, which will be held in Toronto from August 28th to September 9th. It is just twenty-one years since Toronto Exhibition was established as an annual institution under the present management. During that time it has increased five-fold in every direction, and today can fairly lay claim to have assumed a national character. Last year upwards of 300,000 people attended, and this year such arrangements are being made as will warrant the expectation of a still larger attendance. Many entirely new features will be presented, while the exhibits, with an increased amount given in prizes (totalling $35,000), will undoubtedly crowd the six hundred thousand dollars' worth of buildings to their utmost. The usual brilliant military spectacles will be given, illustrating recent famous feats of arms on land and sea by both England and America, and arrangements have been made for an illustration of wireless telegraphy, wireless telephoning and the improved X rays. In short, the Exhibition will be more than ever up to date.

The Lavin saw mill, located at Salmo, B.C., on the Nelson & Fort Shepard Railway, was last week sold at sheriff's sale to G. O. Buchanan, of Kaslo. Mr. Buchanan will remove the plant to Duncan City.

### LUMBER FREIGHT RATES.

CANADA ATLANTIC RAILWAY.

Lumber freight rates on the Canada Atlantic Railway, according to the summer schedule effective April 1st, are as follows : Ottawa, Rockland, Hawkesbury and intermediate points to Toronto, 10 cents per 100 lbs.; Parry Sound to Toronto, pine 10 cents, hardwood, 11 cents; Ottawa to Oswego, $1.90 per M ft.; Ottawa to Syracuse, $2.20 per M ft, (3,000 lbs. and under per M ft.); Ottawa to Montreal, $1.00 per M feet, lath 20 cents per M pieces; Quebec, $2.00 per M feet, lath 40 cents per M pieces; Arnprior to Montreal, $1.50 per M feet, lath 30 cents per M pieces; Quebec, 12 cts.; Pembroke to Montreal, $1.75 per M ft., lath 35 cents per M pieces; Quebec, $2 75 per M ft., lath 55 cents per M pieces; Ottawa to New York, $2.50 per M ft., lath 50 cents per M pieces; Arnprior to New York, $3.00 per M ft., lath 60 cents per M pieces; Pembroke to New York, $3.25 per M ft., lath 65 cents per M pieces; Parry Sound, track, $3.50 per M ft., lath 70 cents per M pieces; Ottawa to Buffalo, 12 cents per 100 lbs.; Ottawa to Port Huron and Detroit, 14 cents per 100 lbs.; Ottawa, Rockland and Hawkesbury to Boston and common points, local 15c.; exports 11c. per 100 lbs.; Arnprior to Boston and common points, local 17 cents, export 15 cts. per 100 lbs.; Parry Sound to Boston and Portland and common points, local 21½ cents, export 20 cts. per 100 lbs.; Ottawa, Rockland and Hawkesbury to Portland, &c., 15 cts.; Arnprior to Portland, 17 cts.; Ottawa to Burlington, 6c. per 100 lbs.; Ottawa to Albany, 10 cts. per 100 lbs.; Arnprior to Albany, 12 cts. per 100 lbs.; Parry Sound to Albany, 17 cts. per 100 lbs.; Ottawa to Scranton and Wilkesbarre, Pa., also Binghampton, N.Y., 13 cents per 100 lbs, from Arnprior 15 cents, from Parry Sound 20 cents per 100 lbs.; Ottawa to St. John, N.B. and common points, 20 cents per 100 lbs.; Ottawa to Halifax, N.S., and common points, 21 cents per 100 lbs. Minimum carload weight for shipment of lumber, lath, shingles, etc., is 30,000 lbs., and rates quoted above are in cents per 100 lbs., except when quoted per M ft.; minimum carloads 10 M ft., lumber not exceeding 3,000 lbs. per M ft.; lath 50,000 rates pieces, not exceeding 600 lbs. per M pcs. Ottawa apply on shipments from Rockland and Hawkesbury.

## LOCATION OF HEADS IN PLANERS AND MOLDERS.

By W. E. S.

If one hundred men were to design one hundred planers, I dare say not two of them would be just alike in all their details. Nor is it desirable that they should be; on the contrary, there should be a difference, taking in consideration the kind of wood and the kind of work they are expected to do. But there are certain principles and details that, to my way of thinking, should be alike on all planers. We will talk a little about the bottom head on a planer or heavy molder.

Glancing over the catalogues of the different manufacturers, we find the bottom head placed in the following positions: (a) Between the first two pairs of feeding-in rolls; (b) after the first two pairs of feeding-in rolls and before the top head; (c) after the top head and before the side cutter heads; (d) after the side cutter heads and before the feeding-out rolls; (e) after the feeding-out rolls or the end of the machine.

Now, from this list there is apparently, among the manufacturers of planers, a difference of opinion as to the proper position of the bottom cutter head. And why? Surely not all of them are right; one of the five ways must be the best way. It can't be that for planing pine the head should be at one end, and for planing mahogany at the other end of the machine. Just because it was first placed at the feeding-out end of planing machines built in this country should be no reason that we should continue to place it there, when by breaking away from custom we can do better work.

The argument advanced is old, but still as good as new. If a person had a board to plane up by hand, he would straighten it, take it out of wind, and then thickness it. If he did it any other way you would kick him out of the mill. At the same time you have in another part of the mill a machine that thicknesses your lumber before it is faced off.

It is a well-known fact that you cannot thickness lumber with the bottom head on a planer, and yet it is expected to do it where the said head does its cutting after the top head. If you will watch a kinked or warped board passing under the top head you will see that the board does not lay down on the platen in spots, and as it passes to the bottom head the thin places in the board will have a tendency to drop down from the pressure bar and are planed still thinner. Try your calipers on such a board and see for yourself.

In the last few years some of the prominent manufacturers have placed on the market planers with the bottom head just after the top head and before the side head spindles. I do not know why they made this change, unless the idea was to bring the top and bottom heads together as closely as possible. One of the manufacturers has the head, platen and rolls connected and arranged so that they may be raised or lowered for taking a light or heavy cut while the machine is in operation. Imagine a board to be passing through a machine of that kind, and you raise or lower the platen. Don't you see that you will have thick and thin places in your board at distances apart corresponding with the distance between the top and bottom heads, or nearly so?

After an extended experience with planers and heavy molders with bottom head cutting first and last, and with two bottom heads and two top heads, the writer has come to the conclusion that the proper place for the bottom head is just before the top head; also, on molding machines and on planers for certain kinds of work, it is necessary to have a second bottom head at the tail end.

For illustration, we run quantities of oak stepping out of five-quarter stock, plowed on both sides, to receive the risers and molded on one edge. The stock will run from one and three-sixteenth inches to one and one-half inches, kinked and warped so much that it is sometimes necessary to take off a quarter or more one side to clean it up. With such stock in view, and running face side down, don't you see the advantage of having the bottom head placed in front of the top head, and arranged to raise and lower while at work? If necessary, you can take off one-sixteenth inch on one board, a quarter inch on another, or an eighth inch on a dozen boards, thus varying the amount to be taken off to conform to the condition of the lumber. As the board passes on to the top head to be thicknessed, it will lay down and touch the platen at all points, allowing the top head to do its work smoothly and bring it to a positive thickness. If an extra smooth finish is desired, the second bottom head comes into play.

I prefer, when the greater part of the face of the pattern to be worked is a plane surface, to work the face side down, as in stepping, for instance. Often a board is thin in places and doesn't dress up, and had we been running face side up it would have been thrown out. The bottom side of a step will admit of a little roughness. And so in flooring; if we run the face side down a number of boards will be thick enough which otherwise would have been cast aside.

Nor is this all. We may have a thick board with a knot on one side. If we run the face side up we are not cutting enough off to cut the knot out, and if we run the other side up we will cut into the knot. A notable example of this class of lumber is North Carolina sap pine.

Were I to build my model flooring machine, I would have two bottom heads, one just before the top head and one at the tail end of the machine. I would have the first bottom head to raise and lower by a screw at the feeding-in end of the machine, convenient for the operator, and with a gauge to indicate the exact amount taken off at all times. I would run my flooring face side down, and hollow out the back side, even on the soft woods.

But, hark! I hear some one say: "You are putting too much work on your flooring. We don't get paid for that work." But I say to you fellows who are "hogging" out the work, while it may take me a little longer to keep my machine in order, I am doing better work than you are. I get a little more per thousand than you do, and my customers like my flooring. I can get more out of a board by taking a light cut off the best side for the face and leaving the excess come off the back side.

I have not originated this idea; it is an old one, followed in European countries as long as planers have been built, from all I can learn. If you were to attempt to sell an Englishman an American planer with bottom head cutting last he would laugh at you. Don't infer that I think an English planer superior to an American planer for general planing. I am speaking of the location of the heads.

Some few American manufacturers have been building planers with bottom heads cutting first, but why they do not take I cannot understand. I can recollect the first one I saw. I did not like the looks of it, but it was not long until I found out its advantages.

Admitting that the proper position for the bottom head is just before the top head, we must also admit that the inside cutter head, or the one next the guide, should cut first on a molding machine, and for the same reasons. I have yet to talk with the man, experienced in this matter, who says that a bottom head cutting first is not a good thing.—Wood-Worker.

## REQUISITES OF THE SUCCESSFUL FOREMAN.

The first requisite of the successful foreman is absolute and unimpeachable honesty. I do not like to hear a foreman tell his men certain things and then warn them not to tell the "old man." I have not time to mention all the undignified subterfuges to which some foremen resort by which to ingratiate themselves with their men, but will simply say abandon this line of tactics altogether and apply yourself to mastering all the details of the line of work it is your duty to direct.

Men very soon learn all your weaknesses and you may rest assured that they will not be slow to direct them to their own ease and advantage. Laboring men do not respect a foreman who does not understand his business, and the control of your men is greatly impaired by any weakness in this direction. The entire respect of your men is a very important adjunct to the successful and profitable accomplishment of your work, and to secure and retain it you must be honest. Men don't respect a dishonest foreman, even when the trait is exercised in their favor.

We will assume, of course, that the question of ability has been settled by your appointment to the position. Now let me enjoin the importance of dignity; but do not confound dignity with arrogance. A great many people imagine themselves dignified, when the truth is they are afflicted with a decided case of arrogance, or, in plainer words, the "big head." You do not have to be haughty and overbearing to be dignified; in fact, you can laugh and joke and be the very embodiment of good humor, and still be dignified. But true dignity will not permit undue familiarity, nor stooping to the recital of obscene stories; neither will it permit you to disparage your men in their absence.

Do not tell one man about the shortcomings of another; tell the man himself in a plain dignified way, and never under any consideration allow the idea to get into your head that your position is a "soft thing" or a "snap." If you have any such idea, dispel it at once, for you are surely neglecting your duty. I have just looked away out in retrospection over an immense industrial field for the place that is faithfully administered that can be called a "snap." Well, I couldn't find it. I don't think there is any such place; you can always find something profitable at which to busy yourself if you will try.

It is not very long ago that a foreman told me that he could do much better work if he was

paid better wages. This is one of the points I want to call your attention to. You must be satisfied with your wages until you fully prove your ability to earn more. If you expect to get one hundred dollars per month next year, you must earn it this year. The man who neglects his work because he considers his wages inadequate cannot reasonably expect to receive any better wages, and he cannot be a very desirable man at any price.

How is your employer to know you are worth more wages unless you demonstrate your ability by actually earning it? You will say that this is not fair. I agree with you; it is not fair, yet it is reasonable. This looks like an inconsistent proposition, but it's not. You certainly should have full remuneration for your services, and on the other hand you should not expect promotion until you have earned it; and you must be careful and not overestimate yourself. It sometimes occurs that a foreman considers himself overworked and underpaid, and gives up his position with the impression that he has been ill treated. A man from the ranks steps in, systematizes the work and does all that the disgruntled man did and more, and then thinks the task easy. The other fellow overrated himself; he was not able to do the work, and his excessive estimate of his worth blinded him to the fact.

You cannot place too high an estimate on the value of system. If you neglect to systematize your work, you will be obliged to deal with emergencies continuously. Your haphazard methods will wear you out and make heavy inroads on your employer's dividends. And this is another point you should hold in view—the "dividends." And do not get in the habit of letting things "pull through." If there is anything going wrong, check it at once. Don't get in the habit of waiting for things to adjust themselves, because they just won't adjust, not by a jugful; they are sure to get worse all the time.

When you have a man that cannot bear correction when he is not doing right, dissolve partnership with him at once, aasuming, of course, that the correction has not been given in the form of abuse. And do not forget that success is the reward of eternal vigilance and application.—D. H. Bloomer, in St. Louis Lumberman.

## SOME POINTS IN MILL MANAGEMENT.

THERE are some points in regard to the management of a lumber manufacturing business that are so evident that it seems unnecessary to call attention to them, and yet they are among the points which most frequently are ignored. Of more importance than the most modern machinery, of more importance than the arrangement of a mill, is the personnel engaged. In the saw mill there are three critical positions upon the proper filling of which largely depends the success of a saw mill management. These positions are those of sawyer, edger and trimmer. They are important for three reasons:

First, the importance of the work these men have to do in fixing the quality of the output of the mill. The sawyer is most important in every particular, for in the matter of quality he has the primary influence, as he handles the logs. The edger man can lose from 25 cents to $1 a thousand on the quality of all the lumber that passes through the edger if he be careless or ignorant. The man in charge of the trimmer can raise or lower the grade and the selling value of the stock in a marked degree.

Secondly, upon these men depend very largely the volume of the product, though most of all upon the sawyer. The lumber he cuts the rest must take care of, and a fast and yet careful sawyer can often increase the capacity of a single band or circular mill 25 per cent. above a man who is not first-class. In mills where there is no esprit de corps, where the ordinary hands about the establishment are intent on seeing how little they can do for their wages, the sawyer of the first class is thoroughly hated, for there is no getting away from the work he throws upon them. The lumber comes through and must be disposed of somehow, and the only way to dispose of it is to put it through the regular process. Yet this does not affect quality provided the edger and trimmer men are of efficiency in proportion to the sawyer.

The third reason why these men are of especial importance is that, locating the sawyer and trimmer at either end and the edger man at the centre of the mill, they form, if they are of the right sort and interested in the work they are doing, a sort of perpetually present set of deputy foremen. Nothing that is going on in the mill in relation to the running of the machinery, or the way it is handled, or the work of the other hands can escape them. In giving these men a pre-eminent place, we do not at all minimize the importance of the filer or the inspector. The former may command as high wages as the sawyer, but his work is that of the expert, done in seclusion, and beyond the furnishing of properly fitted saws he has no influence.

Many a mill fails to be satisfactory to its proprietors, simply because of a penny wise and pound foolish policy in the selection and handling of those principal men in a mill. An ordinary modern mill can better afford to pay $10 a day to either sawyer or edger man than to have a poor one. The foreman of a mill can have no more valuable assistants than these if they are efficient and well disposed toward him and the proprietors.

This question of good will is one that is not often given due consideration. A thoroughly well posted mill man said recently: "I would not have in my employ as superintendent or foreman of any department a man who was not on good terms with all the other foremen, or at any rate with those with whom he comes in contact. The woods foreman aud the mills foreman must be friends; the yard foreman and the planing mill foreman must each be in touch with the mill foreman, and the man in charge of the shipping must not be at outs with the head of any other department. I should expect them to form a sort of cabinet in my interest, always prompt to consult each other about any improvements to be made or defects to be remedied. If I had a foreman in my employ who would come to me with any complaint about any other department without first having gone to the head of that department in a friendly way I would 'fire' him instanter. If the yard foreman sees that stuff is coming out of the mill unevenly sawed, he will at once call the mill foreman's attention to it, provided the feeling between them is what it ought to be and I am to make money, and it will not be necessary for him to come to me with a thing like that; and so on through all the departments of the mill.

"Then, again, I believe in paying my men just a little more than anyone else in the neighborhood does. I know that this policy cannot be followed universally, for if all of us were trying to pay our men more than anyone else we would soon bury ourselves under expense, but there is no danger that men will be overpaid, and I believe that from the foreman down to the common laborer this policy is a money-making one. I need not pay my laborer more than four or five cents more than does my neighbor, but if I do that he appreciates the fact, and I get many times the extra expense out of him in the form of faithful work, and, besides that, have the pick of the men in the surrounding country."

These are ideas which are to be commended to the attention of many lumber manufacturers. There is a disposition to magnify the value of machinery and to underestimate the value of brains; while the fact is that the more costly and intricate the machinery, the higher the class of brains to control it and get from it the best results.—American Lumberman.

## LEGAL DECISION OF INTEREST TO LUMBERMEN.

AN important judgment was rendered at Quebec on June 30th by Judge Caron, in the case of John Livingstone, of Montreal, against Frank Ross, of Quebec. The plaintiff contended that he had an option from Mr. Ross upon all the Ross property, including mills, limits, etc., in Buckingham and elsewhere in the county of Ottawa, and that when he proffered the amount in payment therefor, Mr. Ross repudiated his written agreement. Hence the action which was to compel Ross to carry out the contract or to forfeit $500,000. The defendant denied certain allegations of the plaintiff's declaration, and further stated that prior to August, 1897, the plaintiff requested him to employ him as a broker for the sale of defendant's mills and limits in Buckingham; that the plaintiff was in communication with Messrs. Kenneth, Blackwell and Wilson, of Thos. Robertson & Co., of Montreal, and Mr. Wilson's father, a member of the Imperial House of Commons, all three reputed to be very wealthy, and desirous, according to plaintiff, to purchase property for the manufacture of pulp and paper. His letter giving the option to plaintiff was, he alleges, intended to be only an authority to the plaintiff to negotiate the sale of the Buckingham property to the above named parties and to no others, and it was never contemplated that it should be an option in favor of the plaintiff personally. Judgment was given for plaintiff. The case will be appealed.

## CANADA'S COMMERCIAL AGENTS.

FOLLOWING is the correct official list of Canada's Commercial Agents in Great Britain, British possessions and foreign countries:

J. S. Larke, Sydney, N.S.W., agent for Australasia.

G. Eustace Burke, Kingston, Jamaica, agent for Jamaica.

Robert Bryson, St. John, Antigua, agent for Antigua, Montserrat and Dominica.

S. L. Horsford, St. Kitts, agent for St. Kitts, Nevis and Virgin Islands.

Edgar Tripp, Port of Spain, Trinidad, agent for Trinidad and Tobago.

C. E. Sontum, Christiania, Norway, agent for Sweden and Denmark.

D. M. Rennie, Buenos Ayres, Argentine Republic, agent for Argentine Republic and Uruguay.

In addition to their other duties, the undermentioned will answer inquiries relative to trade matters, and their services are available in furthering the interests of Canadian traders:

J. G. Colmer, 17 Victoria street, London, S.W., England.

Thomas Moffat, 16 Church street, Cape Town, South Africa.

G. H. Mitchell, 15 Water street, Liverpool, England.

H. M. Murray, 40 St. Enoch Square, Glasgow, Scotland.

Harrison Watson, Curator, Imperial Institute, London, England.

# THE NEWS.

—Mr. Wm. Jennings is considering the building of a sash and door factory and planing mill at Fenwick, Ont.

—Mr. Jud. Saunders made a record cut of shingles at Longford Mills recently, cutting 70,600 in ten and three-quarter hours.

—Mr. Shields has submitted to the council of Kamloops, B.C., a proposition to establish a saw mill and sash and door factory there.

—Mr. H. G. Marsh, lumber merchant, of Tonawanda, will probably establish a mill at Welland, Ont., for the manufacture of staves and bolts.

—Messrs. G. Neibergall & Son have taken over O. R. Taylor's mill at Camp Palmer, giving in exchange fifty acres of land in Colchester South.

—It is understood that Mr. D. H. McDowall intends again starting his saw mill at Prince Albert, N.W.T. This mill gives employment to about fifty men.

—The National Hardwood Lumber Association, which assembled in Milwaukee last month, passed a resolution opposing the granting of reciprocity with Canada.

—Love & Drake, lumber merchants, of Red Deer, N.W.T., have dissolved partnership, Mr. Love continuing the business and Mr. Drake removing to British Columbia.

—Messrs. A. H. Edwards and H. N. Williams have formed a partnership as lumber dealers at Carleton Place, Ont., under the firm name of Williams, Edwards & Co.

—Messrs. Winnacott & Irons have rebuilt the planing mill at Burks Falls, Ont., owned by Mr. Duncan McCaffery, and which was almost totally destroyed by fire recently.

—The Rat Portage Lumber Co. has opened a yard at Brandon, with a view to supplying the western trade from that point. Mr. J. D. Kennedy will have charge of this branch.

—The directors of the Central Canada Fair, Ottawa, purpose making the log rolling contest a special feature of this year's exhibition. Contests will be held each day on the lake at the grounds.

—Mr. Walter Shanley, C.E., of Montreal, is making a government survey of the route of the proposed Ottawa and Georgian Bay ship canal, of which Mr. McLeod Stewart, of Ottawa, is the promoter.

—The body of the late C. W. Robertson, bookkeeper for Thomson Smith's Sons, Cheboygan, Mich., was found last month in a lake about ten miles from Webbwood, Ont. He had been missing since December last.

—The Rat Portage Lumber Co. have had plans prepared for a new warehouse to be built in Winnipeg. This warehoure will be 50 × 125 feet, of brick and stone, three stories and basement, and will cost about $13,000.

—The law-suit of Alexander Fraser vs. the Hull Lumber Co., in which the Table Rock property at Hull was interested, has been settled out of court by the Hull Lumber Co. paying the costs since the institution of the action. These amount to about $12,000.

—Andrew Haslam, of Nanaimo, B. C., has a novelty in the way of a dry kiln. The walls are made of sawdust and lime in the proportion of four parts sawdust to one part lime. The walls are six inches thick. Mr. Haslam thinks he has the best kiln on the coast.

—The Royal City Mills, New Westminster, B.C., has received an order from Australia for a sample shipment of ten thousand boxes suitable for shipping canned goods to Europe. This business is no doubt the result of the establishment by the company of an agency in Australia.

—Mrs. M. L. Rochon, of Rockland, is said to have issued a writ against the W. C. Edwards Lumber Co. for $5,000 damages for the death of her husband, who was killed by an accident in connection with the erection of a sawdust burner. The usual claim of negligence is made.

—The Conger Lumber Co.'s mill at Parry Sound, Ont., which has been closed down for the past year or two, is in operation this season, having been refitted and put in first-class shape. The company have a good supply of logs on hand, and expect to run steadily until the end of the season.

—Messrs. Geo. Perley, Fred Avery, Chas. E. Reid and Walter White, of Ottawa, have purchased the mill of the Ottawa Lumber Co. at Calumet, Que., together with an area of 640 square miles of spruce limits. It is the purpose of the purchasers to erect a large pulp mill at an early date.

—Mr. Geo. A. White, agent for the Peoples Bank of Halifax at Woodstock, N.B., is inviting tenders for the purchase of timber lands in Aroostook county, Maine, containing 8,200 acres, also saw mill, planing mill and shingle mill property at Woodstock, N. B. Tenders close on Tuesday, August 15th.

—It is reported that the J. A. Fay & Egan Company, of Cincinnati, Ohio, have been given a contract by Millar & McCromby, of Montrose, Scotland, for a large quantity of saw and planing mill machinery for installing in a proposed saw mill near Quebec. It is said that this mill will probably be the largest in Canada.

—Mr. Thomas Southworth, Clerk of the Ontario Bureau of Forestry, and Mr. Aubrey White, Deputy Commissioner of Crown Lands, have in preparation a history of the crown timber regulations both during the French regime and in the period which has since elapsed. The work will appear as an appendix to Mr. Southworth's forthcoming forestry report.

—An interesting decision is shortly expected in the case of the Dominion Bung Co. vs. the Queen City Bung Co., both of Toronto. A board of arbitrators was asked to decide the question of priority of invention between these companies upon a new machine for cutting bungs for barrels, etc., an industry about to be established in Toronto, and which is believed to be the first of the kind in Canada.

—The Ymir Sawmill Co., of Ymir, B.C., have completed a novel tramway running from the mill to a timber limit which the company recently purchased from the Great Northern Railway Co. The tramway is two miles in length, and trees with the bark peeled off are used for rails. These are firmly bolted together, and upon them runs a car with large grooved wheels some ten inches thick. This car is capable of taking to the mill between two and three thousand feet of logs.

—In the Dominion parliament Mr. Clarke Wallace called the attention of the Minister of Marine to the fact that the Ottawa river was full of sawdust, notwithstanding that there was a law on the statute books to prevent the dumping of mill refuse in such waters. Sir Louis Davies replied that any person who deposited sawdust in the river was liable to the penalty of the law. He pointed out, however, that experiments were being made with a view to utilizing the sawdust, and the result so far had been most satisfactory.

—Mr. Thomas Southworth, of the Ontario Forestry Department, has received from a Canadian proprietary medicine company an enquiry as to the possibility of obtaining tamarac gum in Ontario. Mr. Southworth states that in the highlands of New Ontario, north of the height of land, the tree grows everywhere, but throughout the older part of the province it is found only in swampy places. He suggests that residents in the neighborhood of tamarac swamps might find it profitable to gather the gum.

—As a result of the visit of Hon. J. M. Gibson, Ontario Commissioner of Crown Lands, to the Lake Temagamingue district, a forest reserve is likely to be established in that district. All round the shores of the lake there is a dense growth of white pine greatly in excess of what was believed to exist, and it is understood that the Commissioner will take steps to create it into a forest reserve. As the district is likely to be visited by many tourists, it is necessary that precautions against devastating forest fires should be taken.

—Mr. W. C. Edwards, M.P., president of the W. C. Edwards Lumber Co., recently entertained in shanty style about two hundred guests, including senators, members of parliament and newspaper men. Taking the steamer at Ottawa, the party sailed to Rockland, where, in a large marque erected in front of Mr. Edward's residence, a real shanty dinner was served. After this the demonstrations of life in a lumber camp were carried out. A shanty had been erected at the rear of the grounds, built of red pine logs, with roof of "scoops" and wooden chimney, and in the centre of the floor there was a real "caboose," whereon the wholesome fare of the shanty crew was cooked. The men, called out by a foreman, cut down a couple of pine trees, trimmed and sawed them into logs, skidded them onto the rollways, and loaded them onto sleds. The drive was next illustrated, and finally the booming of the logs at the mill to be cut into lumber.

## CASUALTIES.

—Frederick Dobson, shingle sawyer in Alexander's mill at Campbellton, N.B., had his right hand cut off by coming in contact with the saw.

—In Macdonald's saw mill at Montague, N.S., Thomas Hume was drawn under the saw of a shingle machine, receiving such injuries that he died in a short time.

—Frank Jones, working in a saw mill at Odessa, Ont., fell across a circular saw while it was in motion. The right arm was severed above the elbow, and his forehead cut.

## PERSONAL.

Mr. Richard R. Dobell, of Dobell, Beckett & Co., timber merchants, Quebec, sailed for England on June 15th.

The death took place recently of Mr. Frederick W. Taylor, senior member of the firm of Taylor & Crate, lumber dealers, Buffalo.

Mr. G. F. Stevenson, Dominion Crown Timber Agent at Winnipeg, has gone to the Yukon district on important departmental business.

The sympathy of friends is being extended to Mr. Geo. W. Nickels, of the hardwood firm of Regan & Nickels, Toronto, upon the death of his wife, which occurred on July 11th.

Mr. Arthur H. Campbell, who is engaged in the lumber business in New York city, recently spent his vacation with his parents, Mr. and Mrs. Paul Campbell, of Lorne Park.

Mr. John Durkin, an official in the woods and forests branch of the Ontario Crown Lands Department, died in the General Hospital at Toronto last month. Deceased was an expert in the subject of forestry, and was fifty-seven years of age.

Mr. Fred Dyke, representative in New Brunswick for Thomas B. Neale & Co., timber agents and importers, Liverpool, Eng., has taken an office in Winslow's Law Chambers, Water street, Chatham, N.B. Mr. Dyke is favorably known on the Miramichi.

Mr. L. H. Swan, of the Swan-Donogh Lumber Co., Morth Tonawanda, N.Y., sailed from New York on June 24th, per steamer Umbria, for England. It is Mr. Swan's intention to combine business with pleasure, and to spend a month or six weeks on the European continent.

Mr. J. M. Macoun, of the Geological Survey, Ottawa, has been commissioned by the Dominion government to prepare a Canadian forestry exhibit for the Paris Exposition in 1900. Mr. Macoun is already arranging for a complete collection of native woods, and hopes to prepare an exhibit which will surpass anything yet accomplished.

## TRADE NOTES.

Messrs. Duncan & McLellan, of Campbellton, N. B., recently sold one of their double edgers to Geo. Moffatt, of Dalhousie.

Messrs. Shurly & Dietrich, the well known saw manufacturers of Galt, Ont., are erecting a new bedstead factory, with the intention of concentrating all their works at Galt.

Mr. D. K. McLaren, of Montreal, has opened an office at 69 Bay street, Toronto, where he will keep on hand an assorted stock of the leading sizes in leather belting. He has lately introduced an excellent method of stretching the leather, and manufacturing, as he does, solely from imported English oak tanned stock, with the utmost carefulness, he guarantees entire satisfaction to users of the "genuine oak belting." Mr. J. T. Craig, late of Craig & McArthur, is in charge of the Toronto office.

Robt. Bell, jr., of the Hensall Engine & Machine Works, has just completed a large brick machine for making bricks from sand and cement. This is a want long felt in localities where brick clay is not to be found. These bricks are said to be much superior to clay bricks in every way, have a better appearance, and can be made almost as cheaply as the clay bricks. The machine has just been tested, and is being shipped to Vancouver, B.C. Mr. Bell is also doing a large trade in saw mill machinery, engines, boilers, etc.

# WOOD PULP DEPARTMENT

## FREIGHT ON PULP WOOD.

A new factor has appeared in the export tax controversy between the governments of the United States and the Dominion of Canada, says the Paper Mill. This new and very important factor is the matter of railroad freight charges. Rather than bring his pulp from Canada to his mill in the United States, the American manufacturer will take his mill to the pulp fields. This plan is well stated by the editor of the Canadian Trade Review, who says in a recent issue of his journal: "It is now believed that the desire to avoid the heavy rail charges upon pulp wood to the mills will soon do as much in forcing American pulp and paper mills across our border as an export tax. All those American mills depending on railway transportation for their supply of Canadian pulp wood will soon be induced by considerations of economy to bring their mills to Canadian limits. It is generally understood that the railway companies threw their influence against the agitation for an export duty, as they say it would kill their remunerative pulp wood traffic. Their own high rates may have the same effect. The great necessity nowadays is to lessen the cost of production, and we can trust to that necessity to bring mills to the fine spruce limits of this country. Legislation for the purpose will be unnecessary. Not only will pulp mills gravitate toward the limits, but also paper mills will develop from these, and all under the operation of the same cause, namely, the desire to eliminate as much as possible of the railways' heavy charges."

## USES FOR PULP.

Wood pulp has been used as a substitute for iron steel, wood, stone, glass, ivory and innumerable kinds of animal and vegetable fibre. As a material for car wheels the manufacturers have found it superior to any kind of metal, being about three times as durable as steel and much more elastic. It has been found available as a material for paving bricks, drain tiling and conduits for electric cables. For ivory, which is becoming scarcer every day, cellulose is the best substitute that has yet been found. When properly treated, it is practically proof against heat and moisture, hence it has been found superior to timber as a material for telegraph poles and screws. Cannon, too, and bicycles are made out of wood pulp in Germany and Chicago respectively, while a Frenchman has succeeded in producing a thread from the same substance which he declares can be worked up into all sorts of fabrics. A Vienna inventor declares that his wood pulp leather is superior to animal leather in fineness and durability. Among the other articles made of wood pulp are boats, canoes, cuspidors, pails, flowerpots, tables, chairs, bureaus, barrels, wagons, horseshoes and imitation porcelain ware. The manufacture of silk from wood pulp is now said to be an important industry in England and France.—Popular Science.

## PULP NOTES.

The Cushing Sulphite Fibre Co. have invited tenders for the erection of their pulp mill at St. John, N. B. Mr. Geo. S. Cushing is local manager.

Mr. Wagon, manager of the Dominion Pulp Company at Chatham, N. B., states that the capacity of the mill is being increased from 90 to 120 tons per week.

Mr. John Mather, of Ottawa, has still under consideration the establishment of pulp and paper mills at Keewatin. The proposed output is 100 tons daily.

Mr. T. G. McMullen, M. P. P., of Truro, N. S., has commenced work on the foundation of his new pulp mill to be built on the Salmon river, in New Brunswick.

The first cargoes of cedar for pulp were received at the Behring Paper Mills, Erie, Pa., on July 3rd. The wood was brought from Canada and cost $4.00 per cord.

Labrador is likely to possess a new pulp mill in the near future, Messrs. H. J. Crowe, M. Currie and W. R. Calder, of Bridgetown, N. S., being the promoters.

The pulp and paper mills at Port Rouge, about 40 miles west of Quebec, on the north shore of the St. Lawrence, have been sold to Mr. Goff Penny, of Montreal.

About sixty paper makers and wood pulp merchants of Great Britain left last month for Norway and Sweden, at the invitation of the Scandinavian Wood Pulp and Paper Makers' Association.

The St. John Sulphite Fibre Co. have their mill at Mispec in operation, and are turning out between 25 and 30 tons of pulp per day, which will be shipped to London, Eng. The mill gives employment to 120 hands.

The exportation of wood pulp from the United States is on the increase. Nearly twice as much was exported during May as during the previous similar month, while the period of nine months just ended shows an increase of about 25 per cent. over the preceeding period.—The Paper Mill.

Mr. C. LeBaron Miles, C. E., has recently been making surveys in connection with proposed pulp and paper mills to be established at the Narrows of the Tobique River,

GEO. T. HOUSTON & CO.
CHICAGO, ILLS., U.S.A.

at Andover, N. B. Mr. A. H. Hillyard, of St. John, is the promoter, and Mr. Grover, of Oregon, Maine, is acting as hydraulic engineer.

The London correspondent of the Paper Mill, writing under date of July 1, states that recent arrivals of mechanical wood pulp at British ports included several hundred tons from Newfoundland. According to the customs declarations, the value of 2,100 tons to hand in one week was £3,540—certainly an under valuation.

A recent fire in the works of the Laurentide Pulp Company at Grand Mere, Que., destroyed the chip conveyor, acid and water tanks, building and equipment, sulphur house, sulphur fume cooler house, and acid tower. The loss is about $50,000, partially covered by insurance. The works will start up again about the end of August, when 75 tons of sulphite per day will be manufactured.

Speaking of the proposed pulp mills at Grand Falls, N. B., Senator Proctor, of Vermont, one of the promoters, said that surveys had been made and that prominent engineers in Montreal were at work on plans of mills, dams, canals, etc. The larger mills will be situated at the Falls, but it is the intention of the promoters to construct a smaller mill at the confluence of the St. John river.

Incorporation has been granted to the Trent River Paper Mill Company with head office at Frankford, Ont., and a capital stock of $50,000. The provisional directors are J. S. Lovell, Wm. Bain and E. W. McNeill, of Toronto. The company have purchased the Sills Bros'. water privileges on the Trent river near Frankford, and are engaged in deepening the river, constructing a dam and building a new paper mill.

American wood pulp is to be represented at the Paris Exposition. Mr. Tartleton Bean, director of the Department of Forestry and Fisheries for the United States, says the exhibit in his department will be remarkable for many reasons. There will be no display of natural specimens in the forestry division, but in lieu thereof there will be exhibits of finished lumber which have special uses. In this connection articles manufactured from wood pulp will have much prominence.

Referring to the undertaking of the Occidental Syndicate of London, Eng., at Sturgeon Falls, Ont., a correspondent writes that a large pulp mill has been built and is now in operation, and that daily shipments of large quantities of pulp are being made. Preparations are under way for the erection of paper mills, the intention being to manufacture completely the raw material in the near future. When their plans are fully carried out, the company will have expended nearly $1,000,000.

The charter incorporating the British America Pulp & Paper Co. sets forth that its objects are to acquire and develop timber limits, water powers and mill privileges, and to establish and operate pulp and paper mills, principally at the falls of the Peribonka, Mistassini, and Chamouchouan rivers, in the Lake St. John district, province of Quebec. The capital stock is to be $3,000,000, and Montreal the chief place of business. The applicants for incorporation are: Raymond Prefontaine, Robert Bickerdike, A. A. Thibaudeau, D. A. McCaskill and E. G. Penny, of Montreal.

United States Consul Manhain, of Riechenburg, quotes an account in a local newspaper of a process for making artificial cotton from the wood of the fir tree. It appears that the wood is reduced to thin shavings, which are placed in a washing apparatus, exposed to the influence of steam for ten hours. They are then subjected to a strong preparation of sodium lye and are heated under great pressure for thirty-six hours. The wood is now changed to pure cellulose, and to give this a greater resisting power some castor oil, caffeine, and gelatine are added. The substance is then put into an apparatus and made into threads, which are reeled.

Several Chicago capitalists are looking into the question ef establishing mammoth pulp and paper mills in Canada, and have appointed a representative to report on an available site. This gentleman, speaking of his trip to Canada, said: "You can hardly imagine what a great impetus that the paper business has received in Canada during the past year. Mills are starting up at many places not thought of a couple of years ago. Canada is simply, at its best, an awful, unending forest, and while the edges are being taken off, our grand-children will long be dead before a real beginning is made to clear them away. If there were more railroads in that country it would be easier to get started with such enterprises, but these will, of course, come in time. Meanwhile keep your eyes on Canada for a real, live big boom in the paper manufacturing business."

### PULP FOR JAPAN.

It is learned that the Sault Ste. Marie Pulp & Paper Co., of Sault Ste. Marie, Ont., are shipping five hundred tons of pulp per month to Japan. This is about one-fifth of the total production of these mills. The pulp is shipped by way of Vancouver, Seattle and San Francisco, where it is loaded on vessels for Japan. It will be remembered that Mr. Geo. Anderson, special commissioner to Japan and China for the Dominion government, reported favorably as to the prospects for Canada supplying these countries with pulp, and the trade which has been secured is probably the outcome of his report. These countries have received almost their entire supply of pulp from Norway and Sweden, but it now appears as though Canada would capture much of the trade.

### HEAVY PURCHASE OF SPRUCE LIMITS.

A timber deal of very great importance has been closed in the city of Quebec. An American syndicate has purchased, through Charles Lionais and John N. Hickey, both of Montreal, several large spruce limits on the lower St. Lawrence, agreeing to pay for them $1,850,000. The limits are on the north shore of the peninsula of Gaspe. The purchasers are said to have a capital of $10-000,000 at their command, and are credited with the intention of at once proceeding to build two saw mills and two pulp mills, costing several million dollars, the pulp mills to have a daily capacity of 600 tons each. A party of engineers is now making surveys and planning for the location of the mills. According to reports, the work is to be rushed, as it is stated that Mr. Lionais will be put in charge of 1,500 men to begin operations without delay. Nor is this all. Mr. Lionais is reported to have secured certain other valuable spruce berths below Quebec city. The total area of this tract is put at 1,446 square miles, the pulpwood upon it being described as of the finest quality. It is understood that the International Paper Company are at the back of the purchase.

# Telescopic Band Saw Mill

**The Coming Mill—the Hit of the Century in Lumber Cutting Devices.**

The Telescopic as Erected at Our Works.

The latest and best improvement in

## BAND SAW MILLS

No off-set used on Carriage.

In double cutting Mill both edges of saw are toothed—the advantages of this:

**Cuts Two Boards** in about same time single cutting mill **Cuts One.**

Teeth on both edges equalizes the strain on saw—avoids cracking—saw lasts longer—requires less work to keep in tension.

Teeth on both edges cut their clearance—no danger throwing saw off wheels.

Saw stands heavier feed—strain on both sides being equalized.

Top of cut being always right at wheel where saw leaves it—saw is exceptionally stiff, making perfectly true lumber in fastest feed.

Only extra tools needed over ordinary band: A double grinding or filing machine—special clamp.

Investigate the only mill running in Canada as a **Double Cutter,** operated by J. D. Shier, Bracebridge, and place your orders early.

**EXTRACTS FROM MR. SHIER'S LETTERS RE TELESCOPIC BAND MILL:**

May 19, 1899.—"The Band Mill is first-class; the best mill to make lumber in Canada. It is a dandy; I think you have struck a good thing.'
May 22, 1899.—"The Band is all that could be desired. It is the best lumber rig in Canada to-day."
May 31, 1899.—"The Mill is doing well. I am running day and night."
June 2, 1899.—"It was a good thing to have that mill introduced. They will certainly take the run, and no doubt you will build a large number of them"
June 2, 1899.—"The Mill is all right, and every person is delighted with it."
June 9, 1899.—"Mill doing splendidly. Cut steadily increasing. Fully expect it will reach the 50 M mark in average stock before long (per 10½ hours)."
June 12, 1899.—"The Mill is very satisfactory. It is the coming Mill."
June 17, 1899.—"Well, every person who sees this Mill states that it is the most complete mill they ever saw. I predict a bright future for you in building these Mills. All practical millmen fully agree that this is the mill."
July 5, 1899.—"The Mill is do ng well, cutting good lumber on both shifts."

**Mr. Shier had no assistance outside of his own men in starting and operating the Telescopic—never had the slightest trouble with the Band Mill since he started.**

## St. Catharines, Ont.

We are the Sole Manufacturers of Saws under the **Simonds' Process** in the Dominion of Canada.

There is no process its equal for tempering circular saws. Other makers recognize this fact, as some of them, in order to sell their goods, claim to have the same process. **All such Claims are FALSE,** as the patentee in the U. S. and ourselves are the only firms in the world who use it.

MILL STREAM, QUE., on I. C. R'y, December 17th, 1894.

R. H. SMITH CO., LTD., St. Catharines, Ont.

DEAR SIRS,—Driving a 20 in. 13 gauge saw into frozen hardwood, using a 9 in. 4-ply belt, if it can be done satisfactorily, is a very severe test. Your saws have stood that test better than any I have tried. I have been experimenting with different makes—both home and imported—during the last five years, and give yours the preference. Last order is just to hand and will report on them by and bye.

Yours very truly, JAMES McKINLAY.

---

CAMPBELLTON, N.B., Nov. 17th, 1894.

R. H. SMITH CO., LTD., St. Catharines, Ont.

DEAR SIRS,—In regard to your Shingle Saws, you can say that I have been using Shingle Saws of your make (Simonds) for the past four years, and they have given good satisfaction. I am running nine machines and use a good many saws, but have never had a saw yet that did not work satisfactorily. Before using your saws I used saws of American make, which worked well, but after giving your saw a trial have continued to use yours, as they are cheaper, and in regard to working qualities are all that is needed.

Yours truly, KILGOUR SHIVES.

---

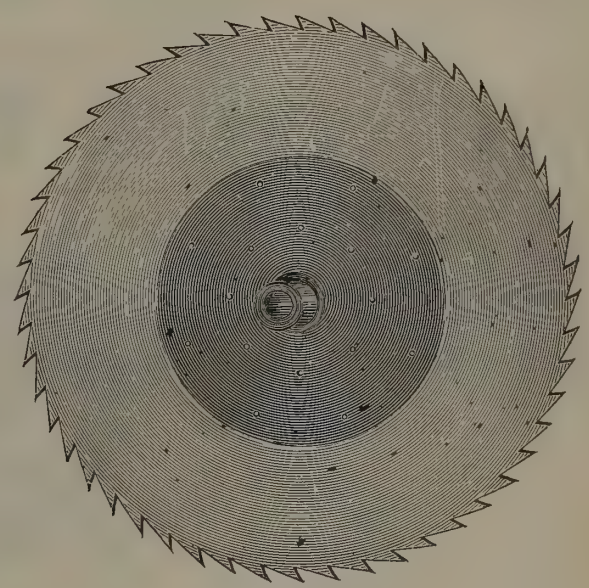
CLAVERING, ONT., May 3rd, 1897.

R. H. SMITH CO., LTD., St. Catharines, Ont.

GENTS,—In reply to your letter asking me how I liked the 62" SIMONDS Saw, I must say in all my experience I never had a saw stand up to its work like the one purchased from you last month. Having used saws for the last 22 years, and tried different makes, I can fully say it is the best saw I have ever had in my mill, and would recommend the SIMONDS' Process Saws to all mill men in need of circular saws.

Yours truly, W. G. SIMMIE.

P.S.—I am sending you my old saw to be repaired; please hammer to same speed as new one. W.G.S.



## THE "LEADER" CROSS-CUT SAW

These Saws are made from the best DOUBLE REFINED SILVER STEEL, warranted four gauges thinner on back than front, and the only Saws on the market that are a perfect taper from the points of the teeth to the back, and require less Set than any other Cross-Cut Saw.

They are tempered by the Simonds' Patent Process, insuring a perfectly uniform temper throughout the plate, and stand without a rival as the BEST, FASTEST, AND EASIEST-CUTTING SAW KNOWN. A gauge to regulate the clearing teeth is furnished with each saw.

Directions for Setting and Filing are plainly Etched on every Saw. None genuine without our Registered Trade Mark as shown in cut.

## THE "LEADER" SAW SWAGE

**Made in 3 Sizes—$2.00, $2.50, $3.00 Net.**

## A FLOATING SAW MILL.

PRESENTED on this page are views of what is believed to be the first floating saw mill to be operated in Canada. It was built last winter at Vercheres, Que., by Mr. J. H. Dansereau. The mill is built on a large scow, which is 100 feet long and 30 feet wide. In the first storey, that is to say, in the hold of the boat, there are two boilers sixty inches in diameter by sixteen feet long, an engine of 125 h.p., the necessary shafting and belting, and apparatus for conveying the sawdust to the fire. Located in the upper storey are appliances for hauling up the logs, a steam kicker, steam log roller, steam nigger, carriage with steam feed, Allis band saw, double edger, slab re-saw, trimmer and slasher, together with a complete system of live rolls, the whole being constructed somewhat similar to the equipment of an ordinary saw mill. The filing room consists of a boat-shaped apartment situated on the roof of the mill.

The machinery for this unique mill was supplied by the Waterous Engine Works Company, of Brantford, and is said to be giving much satisfaction.

In the spring Mr. Dansereau took his floating saw mill to Calumet, on the river Ottawa, at the mouth of the river Rouge, where it has been in operation for some time. Working day and night, its capacity is about 100,000 superficial feet, the timber being spruce. Barges are placed on one side of the mill, the lumber being carried into them and then transported to Montreal for loading on the steamers. The slabs are loaded on cars on the wharf and also shipped to Montreal. The lumber is shipped without being dried, but if it were necessary to dry the lumber before shipping, it would not be a difficult matter to take the mill up to a wharf and pile it on the ground as with any other mill.

Mr. Dansereau finds that there is a great advantage in being able to move his mill from place to place, as the quantity of timber in many districts will not warrant the building of an ordinary stationary mill. This mill can also be used to saw lots of logs which so frequently escape from the boom, while at the same time it does away with the cost of towing logs.

MR. J. H. DANSEREAU'S FLOATING SAW MILL.

## FOREIGN TRADE OPENINGS.

### BUTCHERS' WOODEN SKEWERS.

THE attention of Canadian manufacturers of "butchers' wooden skewers" is directed to the following letter recently received by the Department of Trade and Commerce :

IMPERIAL INSTITUTE ROAD,
LONDON, S.W., 22nd July, 1899.

W. G. PARMELEE, Esq.,
Deputy Minister of Trade and Commerce,
Ottawa.

DEAR SIR,—Upon behalf of certain of your correspondents, I last autumn made some general inquiries as to the possibility of Canadian manufacturers of butchers' wooden skewers obtaining a share of the very considerable trade done in the United Kingdom.

As was then pointed out, the supply here is mainly controlled by the American Skewer Trust, which deals through resident agents. Prices are much cut up, owing to severe competition, and it is a question of small profits on large shipments.

Many English houses are not satisfied with Trust methods, and are prepared to welcome Canadian skewers if they can compete with American.

It may be of interest to quote the following letter written on 21st instant by a large dealer in skewers, who has since I saw him last autumn followed up the matter :

"We have received several small consignments of Canadian skewers. Up to the present they have been very good in quality and have met a ready sale. The only disadvantage is they are rather irregular in forwarding their consignments. We consider they are as good or better value than any wooden skewers at present brought before our notice."

This is to a certain extent encouraging, but this irregularity of delivery is a defect which is absolutely fatal to many Canadian goods which might otherwise do well here.

Many of the large merchants are connected with the American Trust, but there are others who would be prepared to go into the matter with any Canadian manufacturer possessing adequate means of regular production.

The future of this trade appears worthy of the attention of Canadian skewer producers.

Yours faithfully,
HARRISON WATSON,
Curator Canadian Section.

### BROOM HANDLES.

The following letter has been received by the Department of Trade and Commerce at Ottawa regarding broom handles :

DEAR SIR,—As previously stated, I gave the names of the Canadian manufacturers to my inquirers, and have since had a long interview with one of the partners. They claim to do a large trade, have a New York branch, and one of the partners visits the States constantly. They know Canada, and would like to form a connection there if they can find the right people. They must, however, have someone capable of a large and constant output in broom handles, and state that they are at the moment ready to place an order for 3,000 gross, but would require that any Canadian mill doing business with them should give them their whole output. Any firm going into the export trade should, they think, hold spruce limits. Perhaps you can suggest likely people.

The same firm would also like to obtain Canadian mouldings. Several Canadian manufacturers are already represented here, but possibly you know others who would like to work up an export trade.

MR. J. H. DANSEREAU'S FLOATING SAW MILL.

I have heard from several Canadian producers of chair parts, in reference to a previous inquiry.

This wooden ware and turnery trade is one of which Canada should be destined to obtain a large share in the course of time.

It is essentially a trade of large turn-overs and small profits, and would only be advantageous to persons holding large and well-equipped mills. Regular delivery is important, and it is essential that a connection be formed with a large importer and merchant who would assume the financial risk. Direct trade might be possible with the consumer in a few instances, but as a rule large transactions are carried on by the merchants. As an instance I might cite that large people like the Army and Navy Stores buy turnery entirely through merchant importers.

Yours faithfully,
HARRISON WATSON,
Curator Canadian Section Imperial Institute.

## SHINGLES OF PAPER.

A REPORT from Japan states that an ingenious innovation recently started by the Tokyo Card and Pasteboard Co., the largest in Japan, has resulted in markedly facilitating the development of that industry. It consists in making thick tarred pasteboards as substitutes for shingles for ordinary roofing. The paper shingles are now in active demand, being about 50 per cent. cheaper and far more easily managed than ordinary shingles. They do not differ much in point of being proof against fire and water from the ordinary articles.

## CORRESPONDENCE INVITED.

The publishers of the CANADA LUMBERMAN invite correspondence from its readers on any subject bearing upon the lumbering industry. There are many questions affecting the trade of which a fair discussion would be beneficial, while the views of all would be broadened by reading the opinions of others. To every reader a hearty invitation is extended to contribute to our columns.

## NEW STEAM LOGGER.

A NUMBER of attempts have been made to use log haulers in the woods on ice roads, and several contrivances have been planned and constructed, but none with great success. Illustrated herewith is a steam logger invented by Mr. F. S. Farr, of the H. C. Akeley Lumber Co., of Minneapolis. It will be remembered that in the mill of this company the first double acting band saw was tested.

The machine illustrated was built entirely in the woods with what materials and facilities could be obtained, and is therefore somewhat crude in appearance. As will be observed, the boiler and engine occupy two sleds. This was found necessary because the gasoline engine that was first designed to furnish the power, and which was placed on the forward sled, proved insufficient to do the work. This necessitated a change, and Mr. Farr placed an engine on the forward sled and used another sled for a steam boiler. When constructing another machine, both engine and boiler will be placed on one set of runners.

NEW STEAM LOGGER, INVENTED BY MR. F. S. FARR.

One of the superior points of this sled locomotive is claimed to be the arrangement of the propelling gear. The heavy calked wheels are arranged so that they may be raised or lowered automatically with the unevenesses in the road bed and are operated by chain gear that connects them with a shaft lower than their own centres. This has a downward pull on them and holds them to the road. The calking is a specially arranged and patented device automatically cleaned, thus preventing from being clogged up with snow or dirt. Another unique arrangement is the use of the exhaust steam. It is forced out directly under the front of the runners and serves to keep the ice ruts in order, doing away with the necessity for a sprinkler. The illustration shows only four loads, but it has hauled as many as eight sleds with 30,000 feet of logs, and the limit of its capabilities depends only on the power of the engine that operates it.

---

The Hastings Shingle manufacturing Co. is building a new mill, the machinery of which was furnished by the Wm. Hamilton manufacturing Co.

## DOUBLE-CUT BAND MILLS.

A. J. BURTON, in Wood-W rker.

IN the Wood-Worker for July, on page 27, a filer gives his opinion of the double-cut band mill. He says it will not be the mill of the future. In my estimation, this is the very best evidence that the makers of the double-cut mill want. It is only about fifteen years ago when those same people, with others, were trying to make a success of the single-cut mills of to-day, and it was no unusual thing to hear experienced mill men say the band would never be a success or the mill of the future. I, for one, believe it is the coming mill. I am a band saw filer, but have never seen or filed a double-cut band saw, although I tried it on a Clark mill in Pennsylvania in 1897, but could not make a success of it, for the teeth on the back edge would cut out the guides, knock off the corners of the teeth and raise Cain in general, so I decided the idea was no good unless we had a mill built to suit it. But now, as the E. P. Allis Co. have made a mill suitable to run a double toothed saw on, I see no good reason why a good progressive filer cannot do the rest, and make the double-cut mill the mill of the future.

This filer says: "Of course they may be made to run successfully, but they are sure to cause trouble." Now, the only trouble I can see that is most liable to turn up is that if the filer in charge of the double-cut saws is not a progressive filer, he is not likely to be successful, and it will be a hard matter to "hold her down" alongside of superior brother filers. I do not see why there should be any trouble in making a saw perfectly straight with teeth on both sides; it will be much easier to keep the saw straight on its edges for the simple reason that it is cutting with both edges, therefore most of the labor in fitting up the saw will be to put in a good even tension, so the saw will be fully capable of standing as much feed on one edge as it will on the other.

I hope all operators of double-cut mills will bear in mind that about one-half of the filers of single-cut band saws are running their saws straight on the back edge, with a tension in the saws put up to a 32 to 40-foot circle, or tension gauge, and those same single-cut bands are cutting from 40,000 to 60,000 feet per day. Now, why will not a saw do as much from one edge as the other, or both edges cut twice as much as the saw with teeth on one side, and with a straight back? I claim it will do just as much work and stand just as much feed from one edge as the other, although I have never seen a double-cut mill, but I will accept a position as filler for one the first chance I get, and if my saws will not stand up to cut 100,000 feet per day, I will write and tell the readers of The Wood-Worker that I have made a failure.

From what I can learn of those that have seen the double-cut mill work, the greatest trouble is that it cuts a thick and thin board alternately, caused by the saw trying to follow the grain of wood. They tell me if the saw leads in, say one-quarter inch the first cut going ahead, it will lead out in the return cut, and if the log continues to be twisting all the boards will be thick and thin. Now, this may all be so, but I have my doubts as to a saw leading in or out, if it is put up perfectly flat, with a suitable tension and properly fitted teeth.

I was very much amused when I read about the filer who never used a straightedge on a band saw, but simply squinted along the edge of the saw with one eye to find where a high or low place showed on the back, and how he, with hammer in one hand and a piece of iron in the other, hammered the crook out. This reminds me of a mill in Whaleyville, N. C., that I called on in 1896, when I was traveling for a saw company. The saws were cutting to "beat the band." I made my way to the file room, and there, to my surprise, I found the filer rolling his saw and squinting along the back to see when he got it straight enough. When he was done he got a piece of iron and a hammer and tightened up the saw on the wheels of the grinder, then proceeded to level his saw, all with his eye, which he did in about twenty mintes. After he was done I introduced myself and talked about saws, free silver, etc., as this was in August, 1896. Then I asked the filer if he objected to me trying his saws with my pocket straightedge to see how he had them put up. I was surprised that they were put up about as well by this man without a tension gauge or straightedge as it was possible for me to do with both. His saws cut finely, and had no cracks. He had saws that had been worn down from twelve inches to six inches without a crack. When I left the mill I would cheerfully have traded my straightedge, if it were possible, for eyes as good as this filer had.

---

To imitate rosewood, maple is best employed, since its texture approaches that of the rosewood the closest. According to Deutsche Drechsler Zeitung, the maple board must be carefully rubbed down, a handsome color being obtained only if this is attended to. For staining use anilic acids, a dark red one consisting of roesine 10 grammes, coralline 10 grammes, and analine brown 1.5 grammes, dissolved in 1 liter of alcohol, and a pale red one which is obtained by dissolving roseine 10 grammes and coralline 10 grammes in 1 liter of alcohol. With this pale red liquid draw the veins on the maple plate in distances of about millimeters, using a repeatedly divided brush, and fill up the intervening spaces with the dark red mixture. Before drying is completed blend the light and dark stripes with a soft brush, so that they do not appear too sharply defined.

It would seem that beech is likely to become a more popular wood in the near future. I learned the other day that Mr. J. S. Findlay, of Owen Sound, is building a new residence, and that he is using quarter-cut beech for the floor. In the same town, the North American Bent Chair Co. are using immense quantities of beech in the manufacture of their bent chairs. These chairs are all exported, many of them going to Australia. This company have recently rebuilt their factory burned some time ago, and I understand that it is their intention to build another extension almost as large as the existing building. When this is completed, their capacity will be consideraly increased, and a still greater quantity of beech and other hardwood timber will be consumed. It may be a question ere long where to obiain the necessary supply.

* * *

Mr. Frank Southern, son of Mr. James W. Southern, timber merchant, Manchester, Eng., spent a couple of weeks of last month in Canada. While principally on pleasure bent, Mr. Southern improved the opportunity of acquainting himself more fully with timber conditions in Canada, from whence his firm import ready-made pine doors, finished pine flooring, white oak, etc., which in turn they supply to Manchester contractors. It will be remembered that the introduction of these ready-made products was at first strongly resisted both by the contractors and workmen of Manchester, Glasgow and other British towns, but the fact is now recognized that the better policy is to use them in preference to the more expensive goods made at home. In conversation with Mr. Southern, it was learned that his firm have imported from Wisconsin ten times as many of these manufactured doors as they have bought from Canadian manufacturers, on account of the slightly lower price at which the American article could be purchased. As Mr. Southern remarked, "even a penny greater profit on each door is a consideration where so large a quantity is handled." It is understood that a number of the American and Canadian manufacturers in this line have recently come to an agreement, under which prices will in future be regulated. Mr. Southern was asked as to the effect of the Manchester canal upon the trade of his city, and replied that it had been most gratifying. The tonnage has increased from 9,000 tons the first year the canal was opened to 150,000 tons last year. The effect is seen in the extensive building operations in progress to meet the requirements of a large increase in population.

* * *

Early in the month of August Mr. J. M. Macoun, superintendent of the Canadian forestry exhibit at the Paris Exposition, returned to Toronto from a visit of research to some of the saw mills and wood-working plants in Western Ontario, and it was only necessary to glance at his countenance to know that his trip had been a success. He was very enthusiastic over the prospects of a creditable display of wood goods at Paris. To the writer he stated that what he had seen and learned on his trip was intensely interesting. All the mills and factories were busy with orders, many of them running night and day, and even then being unable to keep up with the demand. Notwithstanding this, he was accorded the utmost courtsey and given every assistance towards the preparation of his exhibit. While the display of forest products will include everything from the tree to the semi-finished product, it is Mr. Macoun's intention to give special attention to lines of wood goods which have only been exported during recent years, and for which there is an extensive market in European countries. These might be classed as specialties, and will include mangle rollers, table legs, chair stock, box shooks, butchers' skewers, hubs and spokes, cooperage stock, coffin boards, cigar boxes, basket material, excelsior, etc. The advantage of a larger trade in this class of timber products is that the money expended in working up the timber to a partially finished product will be given to Canadians. Notwithstanding the limited space at Mr. Macoun's disposal, he hopes to make an exhibit which will do justice to Canada as a timber producing country. The province of British Columbia has forwarded its portion of the exhibit, and the display from the Eastern provinces is well under way. In order that every timber product capable of being exported on a commercial basis may be represented, Mr. Macoun extends an invitation to all manufacturers to forward to him a sample of the article they wish to exhibit. He will probably leave for Paris about the first of November.

## NATIONAL HARDWOOD INSPECTION RULES.

The movement in the United States looking to the adoption of national rules for the inspection and grading of hardwood lumber is steadily gaining ground. On July 13th, the National Hardwood Lumber Association, formed with the above object in view, held its first annual meeting in Milwaukee, at which there were present representatives from nearly all the principal markets. The Inspection Committee presented a report recommending certain amendments and changes to the rules as already adopted by the association, and which have been published in the Canada Lumberman. These amendments, as adopted by the meeting, are as follows :

Mill Culls.—The grade of mill culls must be 3 inches and wider, 4 feet and longer, and must contain at least 25 per cent. of clear cutting, not less than 3 inches wide and 2½ feet long, with the exception of basswood, elm and butternut, which may contain 25 per cent. of sound cuttings. This includes the following kinds of woods : Plain-sawed red oak and white oak, ash, birch, maple, basswood, elm and butternut.

Rock Elm.—Firsts and seconds, 6 inches and wider, 10 feet and longer, not over 25 per cent. under 12 feet ; 6-inch and 7-inch pieces will admit of one standard defect ; 8-inch to 10-inch, two standard defects ; 11-inch to 12-inch, three standard defects ; 13-inch and over, four standard defects. Straight splits the width of the piece is no defect in this grade. Common must be four inches and wider, from 6 to 16 feet long, not to exceed 10 per cent. of 10-foot and 15 per cent. of 6-foot and 8-foot, and must work two-thirds clear in not more than three pieces. Culls must not exceed 50 per cent. of 10-foot, and must work 50 per cent. sound in not more than four pieces, and no cutting less than 2 feet.

Ash.—Common, 4 inches and wider, 8 feet and longer ; 4-inch piece must have one face clear ; pieces 5 inches and wider must be of sound character, and work three-fourths clear.

Chestnut.—Add to the grade of firsts and seconds : "Wormholes are excluded from the grade of firsts and seconds."

Cottonwood.—Culls are 3 inches and over wide, from 6 feet to 16 feet long, and include all lumber not equal to common grade that will work one-half or more without waste. Common same as in inspection book.

Hickory.—Grades, firsts and seconds, common and cull ; lengths, 6 feet to 16 feet ; bright sap no defect. Firsts and seconds, 4 inches and up, 8 feet to 16 feet : Pieces 4 inches and 5 inches wide must be clear ; pieces 6 inches and wider must be sound, and work 80 per cent. clear in not more than two pieces ; no cutting to be less than 4 inches wide. The grade of firsts and seconds must contain at least 25 per cent. of firsts. Common must be 4 inches and up wide, 6 feet to 16 feet long, not over 20 per cent. less than 12 feet long, and must work two-thirds clear in not more than three pieces ; no cutting to be less than 3 inches wide and 3 feet long. Culls are to include all lumber below the grade of common that will work at least one-half clear in four pieces ; no cutting to be less than 3 inches wide and 2½ feet long.

Plain-sawed Red Oak and White Oak.—Common shall be 4 inches and wider, 8 feet and longer, not to exceed 20 per cent. 8-foot and 10-foot lengths ; pieces 4 inches to 6 inches wide, 10 feet and longer, shall work ¾ clear in not over two pieces ; 8 feet and 10 feet long shall work ¾ clear in not over two pieces. Pieces 6 inches and wider, 12 feet and longer, shall work ¾ clear in not to exceed three pieces ; no cutting to be less than 3 feet long ; bright sap no defect in this grade.

Quarter-sawed Red Oak and White Oak.—Common shall be 4 inches and wider, 8 feet to 16 feet long ; 4-inch and 5-inch to contain not over one standard defect ; 6-inch and wider to cut at least 75 per cent. clear in not over two pieces ; bright sap no defect in common grade. Clear quartered red oak and white oak strips, 1-inch and thicker ; width, 2½-inch, 3-inch, 4-inch, and 5-inch ; 8 feet to 16 feet long ; the 2½-inch and 3-inch to have one face free of sap ; the 4-inch and 5-inch may contain 1 inch bright sap. (Note.—All quartered oak must show figure on one side to eliminate the last sentence in note of inspection book, where the rule says : 'The ray should show an angle of 45 degrees.')

Mahogany.—Grades : Firsts and seconds, common and cull, and shorts ; firsts up to 18 feet, as per book ; 18 feet to 20 feet, two standard defects. Seconds, 6 inches and wider ; length, 18 to 20 feet ; not more than 15 per cent. of 10-foot lengths ; 5 per cent. under 10-foot lengths ; pieces 6 inches wide must be clear ; 7-inch to 9-inch, one standard defect ; 10-inch to 12-inch wide may have two standard defects ; 13-inch and wider, three standard defects ; 18-foot to 20-foot may have one additional standard defect. Change the name of 'X' to common grade, 'O' grade to cull. Balance of the rules to conform to the rules in inspection book, except that the clause requiring 75 per cent. of firsts in the first and seconds be stricken out.

An oldtime Maine lumber operator says that the large amount of white birch of large size to be found in that state is due to the action of officials nearly seventy-five years ago. He says that in 1820 some French Canadians squatted on state land near the Penobscot river and defied all efforts to eject them. Finally, in 1825, two special constables were sent to the place from the land office in Augusta with instructions to make a clean job of the evictions. The constables, after turning the families out, set fire to their houses and haystacks. Twelve hours later the French village was a mass of ruins, and the biggest forest fire ever known in the state was sweeping north and burned more than fifty townships of virgin pine. Of this land about 5,000,000 acres came up to wild cherry and white birch saplings, and, after a struggle for supremacy, the latter prevailed, and that great territory is known as a birch country.

THE CANADA LUMBERMAN
WOOD WORKERS' MANUFACTURERS' AND MILLERS' GAZETTE

MONTHLY AND WEEKLY EDITIONS

PUBLISHED BY

The C. H. Mortimer Publishing Company of Toronto, Limited

CONFEDERATION LIFE BUILDING, TORONTO

BRANCH OFFICE:
NEW YORK LIFE INSURANCE BUILDING, MONTREAL

The LUMBERMAN Weekly Edition is published every Wednesday, and the Monthly Edition on the 1st day of every month.

TERMS OF SUBSCRIPTION:

One Copy, Weekly and Monthly, One Year, in advance..... $1.00
One Copy, Weekly and Monthly, Six Months, in advance..... .50
Foreign Subscriptions, $2.00 a Year.

ADVERTISING RATES FURNISHED ON APPLICATION

THE CANADA LUMBERMAN is published in the interests of the lumber trade and allied industries throughout the Dominion, being the only representative in Canada of this foremost branch of the commerce of this country. It aims at giving full and timely information on all subjects touching these interests, discussing these topics editorially and inviting free discussion by others.

Especial pains are taken to secure the latest and most trustworthy market quotations from various points throughout the world, so as to afford to the trade in Canada information on which it can rely in its operations.

Special correspondents in localities of importance present an accurate report not only of prices and the condition of the market, but also of other matters specially interesting to our readers. But correspondence is not only welcome, but is invited from all who have any information to communicate or subjects to discuss relating to the trade or in any way affecting it. Even when we may not be able to agree with the writers we will give them a fair opportunity for free discussion as the best means of eliciting the truth. Any items of interest are particularly requested, for even if not of great importance individually they contribute to a fund of information from which general results are obtained.

Advertisers will receive careful attention and liberal treatment. We need not point out that for many the CANADA LUMBERMAN, with its special class of readers, is not only an exceptionally good medium for securing publicity, but is indispensable for those who would bring themselves before the notice of that class. Special attention is directed to "WANTED" and "FOR SALE" advertisements, which will be inserted in a conspicuous position at the uniform price of 15 cents per line for each insertion. Announcements of this character will be subject to a discount of 25 per cent. if ordered for four successive issues or longer.

Subscribers will find the small amount they pay for the CANADA LUMBERMAN quite insignificant as compared with its value to them. There is not an individual in the trade, or specially interested in it, who should not be on our list, thus obtaining the present benefit and aiding and encouraging us to render it even more complete.

## RESTRICT THE LUMBER PRODUCTION.

THE fact has been stated in this journal, and is borne out by almost daily reports, that the lumber business of the Dominion is in a most prosperous condition. There is scarcely a branch of the industry, from the cutting of the tree to the manufacture of the finished wood product, that is not employing more labor and more capital than was the case twelve months ago. The reason for this is the increased demand resulting from the generally improved commercial conditions in nearly every country in the civilized world.

Entering, as we seem to be, upon an era of greater prosperity, the tendency is for manufacturers to largely increase their production with a view to meeting the prospective demand and to making profits to offset the years of business depression, when, it is admitted, goods were frequently sold at the bare cost of production. This disposition on the part of manufacturers is only natural; nevertheless, this same disposition has more than once in the past been a strong factor in breaking down an otherwise promising market. These remarks are particularly applicable to the lumber trade, owing to the somewhat peculiar conditions surrounding it, and a word of warning at this time, when preparations for logging operations are being made, may not be amiss.

Present indications point to a large demand for lumber next year, both on local and foreign account. Notwithstanding this, our advice to manufacturers is to restrict their production. By this policy there is everything to gain and little to lose. Prices are now moving upwards, and it would be a great mistake to so increase the production of logs this winter as to overstock the market with lumber next season. The log cut, taking the Dominion as a whole, should be little larger, if any, than last winter. The object of manufacturers should be to realize a fair profit on a limited output. It should be borne in mind, therefore, that the cost of labor has increased with the greater demand therefor, and that the lumber cannot be manufactured as cheaply to-day as it could be two years ago. Stumpage values are also higher. This we regard as an argument in favor of restricting the production of lumber.

As timber becomes less plentiful, it devolves upon the people of Canada to be more conservative in regard to its use, with a view to perpetuating the supply. In this aspect of the case lumbermen are quite as much interested as the public generally. Thus the advantage of manipulating the timber in such a way as to obtain the best possible returns from a minimum quantity of timber.

We commend for the consideration of saw mill owners the policy adopted by Mr. John Bertram, manager of the Collins Inlet Lumber Company. Mr. Bertram has fixed a certain quantity of timber to be cut each year, which must not be exceeded, the object sought and which he hopes to attain being to secure a permanent supply, after the forestry methods adopted in some European countries. Mr. Bertram has given the subject of reforestation much study, and for that reason we believe his course of action might safely be copied by other lumbermen.

To revert to the vital object of this article, we would strongly urge upon saw mill owners to pursue a conservative policy in regard to their output. Profit by the example of this year, when nearly every lumberman in Canada has done a successful business, even though not a large one. Let the world get hungry for our lumber and timber products, and in the end we will profit thereby.

## SEASONING OF TIMBER.

MUCH interest is shown on this side of the Atlantic in the numerous experiments that have been conducted in European countries to preserve wood from decay. The attention that has been given to this subject in Germany, France and Great Britain is no doubt due in a great measure to the growing scarcity of timber in these countries, as with increased value naturally comes increased care and science in its use.

The usual way of protecting wood from decay is by impregnation with a preservative. The Southern Pacific Railway treats piles 110 feet long by evaporating the moisture at 230 degrees and filling its place by creosote at the same temperature. This process is said to be perfect. All microbes, bacilli and animalculae avoid creosote; and the teredo, which makes nothing of the hardest timber, is said by the Portland Oregonian to "stand off and gnash his teeth in rage as he contemplates the creosote treated piling" of the Southern Pacific. This process is expensive, one dollar's worth of creosote being required to preserve one cubic foot of wood. A cheaper process is under experiment in France, where engineers have succeeded in extracting the sap by electric osmosis and sucking into its place an antiseptic mixture of borax and resin. This method is known as the Nodon-Bretonneau process, and is referred to elsewhere in this issue. Another inventor whose work is still in the experimental stage has examined extracted sap, and finding it to be albuminous and coagulable, has taken a hint from hard boiled eggs and solidified the sap in place. He claims that, without making the wood hard to work, he has removed the possibility not only of decay but of shrinkage.

The capacity for interminable shrinkage is the great fault of wood, and, for any fine and permanent use of the material, something must be done to overcome this fault. The trouble seems again to lie in the sap, so that woods treated with preservative after extraction of the sap should be comparatively free from shrinkage. The simple practice of soaking in a pond, which is practised in country places, has this end in view; and it is far more effective than kiln drying. The rapid swelling, when exposed to moisture, of kiln dried wood which has received no other treatment, as compared with the comparative steadiness of soaked boards, seems to point to the sap as the seat of the hydroscopicity of wood. To dry in a kiln a board with the sap in it is to deprive it temporarily of its moisture, so that it comes out of the kiln hungry, and paint cannot keep from it the moisture it craves.

It is of little use to specify a condition of dryness which cannot be made permanent. The wood is bound to attain the same proportion of moisture as the air of the house. The air of inhabited houses is found to contain usually about 10 per cent. of moisture. Flooring or other finish ought therefore to be brought into the house when the building has reached as nearly as possible its normal condition of dryness and temperature, and the wood ought to contain about 10 per cent. of moisture. It is easy to ascertain the proportion of water. If a piece is cut from the middle of a floor board, weighed, heated till dry and weighed again, the difference between the two weighings is the weight of moisture, and this should be ten per cent. of the weight of the piece when dried. If, as is usually the case, there is little hope of precision in the proportion of moisture in the wood, and good work is still sought, there remains the expedient of specifying quarter cut wood. It is the unequal consistency in the structure of the rings that makes tangentially sawn boards warp under shrinkage.

The summer wood in the annual ring is thicker than the spring wood, and takes up and parts with more moisture than the spring wood. In tangential boards these portions of the ring are often opposed to one another, and the consequence is warping. There may also be a great width of summer wood and consequently great shrinkage. If quarter cut wood is used the shrinkage will be much less and there is nothing to cause warping, for the structure is the same on both sides of the board.

There is this to be said in addition in favor of seasoning by soaking, that it is as effective to prevent decay as it is to prevent shrinking and swelling. It is the sap and soluble portions of the wood that form the food of the fungus of disease, and when these are washed out the liability to decay is gone.

In the matter of inflammability, much may be

done by treatment of the wood. The application of silicious compounds has in experiment produced such results in England as to cause a decrease of 50 per cent. in fire insurance rates for buildings in which the wood is treated in this way. Experiments by the Belgian government exhibited the efficiency of treating wood with a solution of ammonium salts. Ammonium phosphate was found to be the most efficient. By the production of a non-combustible vapor, fire, which attacked untreated wood in less than two minutes, was retarded in its action for forty minutes. Such retardation is all that can be expected, but it is sufficient to reduce the inflammability of wood so that it is no longer a menace to the building in which it is used, but will instead prevent the spread of flames for such reasonable time as is necessary to let the fire department get to work. Thorough impregnation with ammonium phosphate, at 25 cents a pound, would be expensive, as it would require about four pounds to the cubic foot, but thorough impregnation is not considered to be necessary.

It is evident that, with proper care and the application of science, wood can be made more efficient than it is as we use it. Greater care is the natural accompaniment of greater value, and the time is not far distant when the value of wood will rise to the point of *finesse* in its use.

## EDITORIAL NOTES.

ALMOST each day emphasizes the necessity of some authorized inspection rules by the lumber interests of Canada. As we have before intimated, it might not be practical to adopt rules applicable to the trade of the whole Dominion—provincial rules, corresponding as nearly as possible to each other, would probably be preferable. We believe such rules to be the greatest necessity of the hardwood lumber trade of the present day, and this necessity will become intensified as our export trade increases. It might be in order to enquire what is being done in this direction by the Ontario Lumbermen's Association?

JUDGING by statements appearing in the United States press from time to time, the opinion is prevalent in that country that it was only during recent years that the Ontario government placed any restrictions on the exportation of saw logs. This, however, is entirely erroneous. The writer was recently shown a copy of the crown timber regulations dated August, 1851, in which appeared the following clause:

"All saw logs cut in future upon public lands, if exported from the province, shall be paid for at double the rates mentioned above respectively."

It would seem that nearly fifty years ago the provincial authorities were alive to the wisdom of fostering home manufacture.

A REPRESENTATIVE of the CANADA LUMBERMAN who recently returned from a trip to the Pacific coast was much impressed with the prevailing activity in all lines of business, but particularly in the lumber trade. From the Lake of the Woods, whose mills supply the Manitoba market, to Victoria, every saw mill plant was operating to its full capacity, and the most general complaint was inability to keep pace with orders. While the British Columbia manufacturers expect to be able to considerably increase their foreign shipments of lumber, it is to Manitoba and the Northwest and to the mining districts that they look for the greatest expansion of trade. Already the consumption of no small quantity of lumber can be attributed to mining work. The residents of the coast province are a truly loyal class of people, who have unbounded faith in the future of western Canada.

THE granting by the Dominion government this year of over six million dollars as subsidies to railways will certainly have an important bearing upon the development of the lumber and pulp industries of this country. It will insure the building of railways in districts heretofore unreached, and which abound with spruce and pine timber. It will also open up undeveloped mining and agricultural lands, which in turn will augment the lumber requirement. The extension of the Ottawa and Gatineau Valley railway may be taken as an example. When the road is completed to Eagle Bay, on Victoria Lake, there will be opened up timber berths heretofore inaccessible only by the Ottawa river, which route is, however, almost impracticable owing to the lack of improvements on the tributaries. The distance to Ottawa by this undesirable water route is 550 miles, while by rail it would be little more than one-third of that distance.

## TWO TREASURY DECISIONS.

IN the weekly report of United States treasury decisons bearing date of August 3 there are two of interest to the Canadian lumber trade. One reports the supreme court decision on that famous Burlington case involving the question as to what is dressed lnmber. It dates back before the passage of the present tariff act. The merchandise involved consisted of planed, tongued and grooved lumber on which duties were assessed at the rate of 25 per cent. ad valorem as a manufactured wood. The importer protested, claiming that the merchadise was entitled to free entry as dressed lumber. The board of general appraisers sustained the collector, but in the U. S. circuit court the case was decided adverse to the government, and the U. S. supreme court now holds that although the lumber in question had been tongued and grooved, it had not ceased to be dressed lumber and had not become a new and distinct manufacture; in other words, that tonguing and grooving is an additional dressing but does not make it a different article. This decision will serve as an interpretation to the present act on this point.

Another decision is as to the duty of staves, beveled and chamfered. The digest of the opinion of the general appraisers is as follows:

The goods are spruce barrel staves about eighteen inches long, four inches wide and three-eighths of an inch thick. They were assessed for duty as manufactures of wood at 35 per cent. under paragraph 208, act of July, 1897, and were claimed to be dutiable at 10 per cent. under paragraph 202.

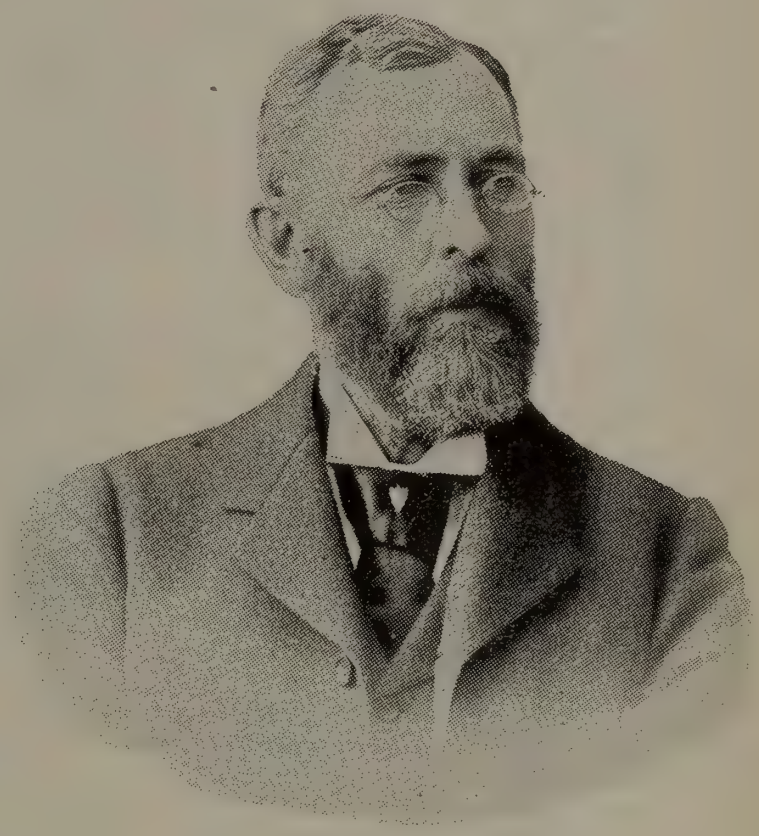
The ordinary staves of commerce are flat sawed or split strips of wood, while these in question have been beveled at the ends, chamfered or grooved for the headings, and fashioned or bent into form ready to go into the "dry" barrel for which they were intended. They are still, however, nothing more nor less than staves.

Paragraph 202 reads: "Pickets, palings, and staves of wood, of all kinds, ten per centum ad valorem."

Under this provision the goods are entitled to classification as staves, and the protest sustained accordingly.

## MR. ELIHU STEWART.

THE accompanying portrait will introduce to readers of the CANADA LUMBERMAN Mr. Elihu Stewart, who has recently received an appointment by the Dominion Government as Chief of the Bureau of Forestry. Mr. Stewart was born at Sombra, Lambton County, Ontario, was educated at the public school and at the Normal school in Toronto, and admitted as a Dominion and Provincial Land Surveyor in 1872. For over twenty years he has been engaged on Ontario and Dominion surveys, extending from the Ottawa river to the Rocky Mountains, and has thus obtained a wide knowledge of the various woods of Canada. He has frequently been employed to make estimates of standing timber, and has acted as arbitrator in timber matters involving hundreds of thousands of dollars. He has also had some experience as a lumberman on his own account, and is well posted on practical forestry. Mr. Stewart was for two years president of the Association of Land Surveyors; and was one of the founders of the Canadian Magazine, to which he has been an occasional contributor.



MR. E. STEWART,
Chief of the Dominion Bureau of Forestry.

Mr. Stewart is a resident of Collingwood, Ont., where he has served as a member of the council and as mayor of the town. A Liberal in politics, he contested the riding of North Simcoe in 1896 against the late Dalton McCarthy, but was unsuccessful.

Heavy forest fires are reported from British Columbia, where considerable timber along the Crows Nest Pass railway has been destroyed. The Canadian Pacific railway lost a quantity of logs.

# THE RETAILER AND Wood-Worker

## NEW PROCESS OF FIRE-PROOFING WOOD.

THE best method of impregnating wood in order to render it incombustible, said Mr. C. J. Hexamer, Ph. D., in the course of a lecture recently delivered before the Franklin Institute, London, is the following :—In the first place, use only well-seasoned timber, thoroughly air and kiln-dried, and impregnate, whenever possible, the finished articles. Then place the wood in a strong metal chamber, specially made for the purpose, capable of withstanding strong pressures, and provided with a lid that closes it hermetically. The receptacle is surrounded by a steam jacket, so that the temperature in it can be regulated at will. The interior of the chamber must be thoroughly dry before the wood is placed there. The lumber should not be steamed before saturating it, although this custom is still prevalent in many creosoting works. The laborious tests of Drude have conclusively proved that steaming wood before impregnating it with solutions tends to lessen its absorptive powers, and therefore it should be as dry as possible. The temperature in the receptacle is slowly increased above the boiling point of water, and is maintained until all the moisture in the wood has been expelled and the mass is equally heated throughout. The chamber is then hermetically sealed and the temperature in it is reduced to 60 degrees C., and held there. The air in the receptacle is now extracted as quickly as possible by means of an air pump. The more complete the vacuum, the better will be the ultimate results. Few persons have any idea of the amount of air contained in porous substances like wood. After the air in the wood has been removed, a solution of water glass of about three times its volume of water, previously heated to 60 degrees C., is sprayed into the vacuum. This method of injection is used to remove the air in the solution. The solution must not be too dilute, but, at the same time, not so thick as to refuse to enter the finest tissues of the wood ; in other words, it must be of such consistency that after impregnation it is completely retained in the pores. It is almost needless to add that the final results depend on the completeness with which the moisture, sap, and air have been removed from the wood before impregnation. For ordinary purposes a block of wood can be made fire-resisting by repeatedly soaking it in a water-glass solution, and, when dry, coating it with a mixture of the liquid and cement. To return to the process, when the wood has become saturated with the solution at normal conditions, hydrostatic pressure of about ten atmospheres is applied and maintained for three hours ; this drives the liquid through the mass. Numerous experiments made in Germany for the conservation of wood have conclusively demonstrated that the "hydrostatic pressure method" is the only one to be relied upon for forcing solutions to the innermost parts of a log.

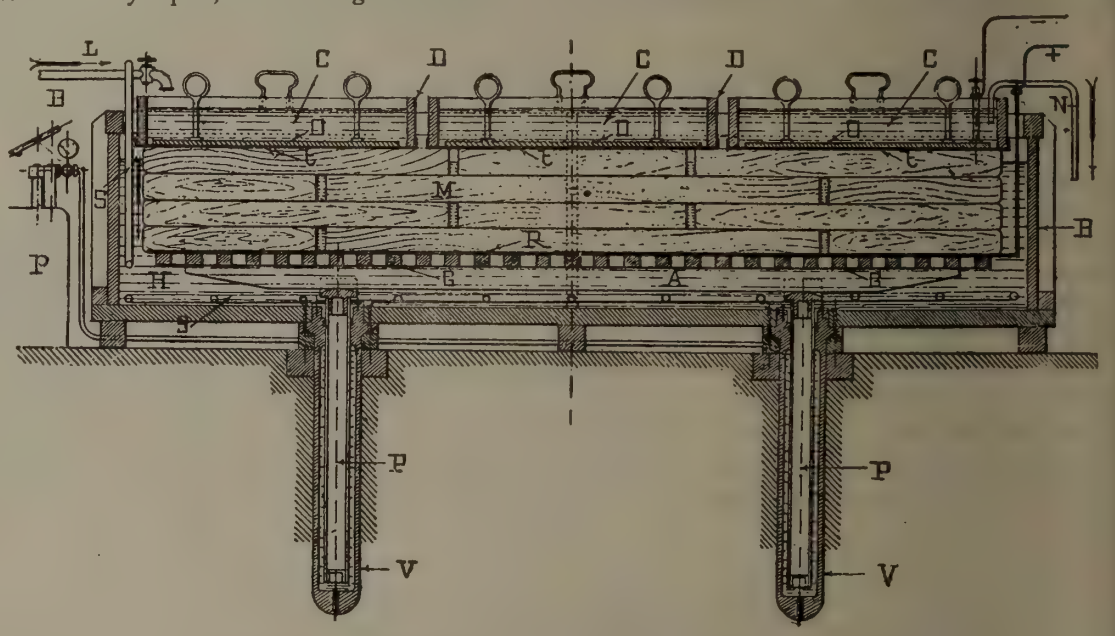
The question now becomes, What to use to precipitate insoluable silicia from the solution of soluble glass, thereby forming an insoluble compound in the fibres? A dilute solution of hydrochloric acid was tried at first, but this affected the wood, and would in practice, attack metal receptacles. Gaseous and liquefied carbonic acid were experimented with, also calcium chloride, until finally a solution of ammonium chloride—a very cheap substance—was used with excellent results. This produces in the very fibres of the wood a gelatinous precipitate of silica. To apply this secondary liquid, the water-glass solution is drawn from the receptacle, and the before-described process is repeated with the ammonium chloride solution. In practice it may be found advantageous to use a second receptacle, removing the wood from one to the other. The pressure should be applied gradually in the second treatment, so as not to force out the first solution. After the precipitation has been completed, the wood is thrown into a stream of running water to dissolve and wash out the salt near the surface, and is then slowly dried. It may be of interest to add that, as a secondary result of the experiments—by using stronger solutions than are necessary for fire-proofing purposes—some beautiful specimens of petrifaction were obtained ; a piece of filter paper was turned into stone, and looked like a delicate film of some pure white siliceous mineral. It is therefore possible that this process can in future be utilized in the arts to petrify organic substances.

The firm of Buckel, Bechtler & Heinstock are building a new saw-mill at Nipissing, Ont.

## SEASONING TIMBER BY ELECTRICITY.

SINCE the references in the July number of the CANADA LUMBERMAN to a method of seasoning timber by electricity, as adopted in Europe, several communications have been reecived from subscribers requesting further information. We therefore publish an illustration of the apparatus for the purpose as patented by Messrs. A. L. C. Nodon and C. A. Bretonneau, of Paris, France, who have introduced further improvements into their patent.

The apparatus used remain essentially the same, the modifications being improvements of detail, including the employment of a stronger current of electricity, and in modifications of the apparatus to make it more efficient, lighter and easier to handle. The improved bath is composed of a solution of 10 per cent. of neutral borate of soda and 5 per cent. of resinate of soda maintained at a temperature of about 35 degs. C. during the process. The electric current which causes the electro-capillary changes, and causes the sap of the wood to be extracted by the borate, has an electromotive force of 50 volts, sufficient to traverse 50 to 60 centimetres of wood and complete the operation in five hours. The solution of borate and resinate of soda penetrates by reason of the electro-capillary action, into the whole mass of wood, and produces a thorough extraction of the sap, which is carried towards the anode and remains mixed in the bath. To facilitate the manipulation of the woods, and to obtain a controllable immersion, according to the progress of the treatment, the patentees have devised the arrangement represented in the illustration, in which H indicates the bath, S the heating coil, L the water supply pipe, O the negative pole (cathode). The frame of double lower bottom rests on the support, A, upheld by the pistons, P, of an hydraulic jack, V. This latter is manipulated by a pump, p, and the pistons, P, can either be raised or lowered as desired. When the latter is raised, the wood can be placed on the frame, and then be plunged in the vat, B, by lowering the pistons. The same action reversed serves to withdraw the wood after treatment. The upper porous partition C has also undergone a modification in its construction to make it lighter and less expensive ; it is now composed of a number of sashes or frames, D, the bottom of which is formed of strong sail-cloth, t, fixed with brass nails. These frames are lighter and more convenient to handle, and are conductively connected together.



THE NODON-BRETONNEAU PROCESS OF SEASONING TIMBER BY ELECTRICITY.

## WEEKLY EDITION

The Lumberman Monthly Edition, 20 pages } $1.00 PER YEAR { The Lumberman Weekly Edition, every Wednesday

*THIS PAPER REACHES REGULARLY THE PRINCIPAL LUMBER MANUFACTURERS AND DEALERS THROUGHOUT CANADA, AND WHOLESALE BUYERS IN GREAT BRITAIN, THE UNITED STATES, AND OTHER FOREIGN MARKETS.*

VOL. V. TORONTO, ONT., AUGUST 30, 1899 No. 32.

## CANADA LUMBERMAN

PUBLISHED BY

**The G. H. Mortimer Publishing Co'y of Toronto, Limited**

*Confederation Life Building - TORONTO.*

Branch Office:
NEW YORK LIFE INSURANCE BUILDING, MONTREAL.

**Weekly Lumberman,** published every Wednesday. Contains reliable and up-to-date market conditions and endencies in the principal manufacturing districts and leading domestic and foreign wholesale markets. A weekly medium of information and communication between Canadian timber and lumber manufacturers and exporters and the purchasers of timber products at home and abroad.

**Lumberman,** Monthly. A 20-page journal, discussing fully and impartially subjects pertinent to the lumber and wood-working industries. Contains interviews with prominent members of the trade, and character sketches and portraits of leading lumbermen. Its special articles on technical and mechanical subjects are especially valuable to saw mill and planing mill men and manufacturers of lumber products.

☞ Subscription price for the two editions for one year, $1.00.

LUMBERMAN'S

VEST-POCKET

INSPECTION BOOK

Containing Rules for the Inspection and Measuring of Pine and Hardwood Lumber in the leading markets of Canada and the United States. Embracing also many useful tables and calculations of everyday service to lumbermen.

*Prepared by the Editor of the Canada Lumberman."*

Toronto, Canada
C H. MORTIMER, Publisher
1895

THE above is a fac simile of the title page of the latest and most complete Lumber and Inspection Book published.

We shall be pleased to send you a copy on receipt of four 3 cent Canadian postage stamps

THE CANADA LUMBERMAN,
*Toronto, Canada*

## WANTED AND FOR SALE

Advertisements will be inserted in this department at the rate of 15 cents per line each insertion. When four or more consecutive insertions are ordered a discount of 25 per cent. will be allowed. This notice shows the width of the line and is set in Nonpareil type; 12 lines make one inch. Advertisements must be received not later than 4 o'clock p.m. on Tuesday to insure insertion in the current week's issue.

### WANTED.

LOT OF THIRTY OR THIRTY-TWO INCH Pine Lath; quote lowest cash prices. J. F. STENGEL, Ellicott Square, Buffalo, N.Y.

WANTED FOR CASH—All kinds of Hardwood Lumber. JAMES MORRISON, 552 Yonge Street, Toronto.

### WANTED.

NUMBER ONE AND NUMBER TWO PINE Lath. MIXER & Co., Buffalo, N.Y.

FOR SALE IN PARRY SOUND, ON SOUTH River, near Trout Creek, 800 Acres Good Soil, timbered with Pulp Wood and Birch. Box 30, CANADA LUMBERMAN.

HAVE YOU ANY STOCK WHICH YOU WISH to sell? If so, make the fact known to probable buyers by placing an advertisement in this department. Address, CANADA LUMBERMAN, Toronto.

I WANT TO CORRESPOND WITH MANUfacturing companies building Wood-Working Machinery regarding the building of machines which cost about Three Hundred Dollars. "J. F.," care of CANADA LUMBERMAN.

### WANTED.

TOW BARGE WANTED FOR STEAM BARGE Chamberlain; must carry 400,000 or 500,000 feet of lumber. Apply with full particulars to C. BECK MFG. Co., LIMITED, Penetanguishene, Ont.

### FOR SALE

A FIRST-CLASS LUMBER AND SHINGLE Mill, average capacity per day 35 M. feet lumber, 70 M. shingles, and 15 M. lath; situated in Huntsville, close to the G. T. R. station, with sidings to mill; plenty of virgin pine. Also a first-class site for a tannery, plenty of tan bark. Will be sold at a bargain. Apply to T. WHALEY, Huntsville, Ont.

### SAW MILL FOR SALE.

THIRTY-FIVE HUNDRED DOLLARS BUYS Saw mill worth double this amount, if taken at once; 2 Boilers 120 h.p., Engine 100 h.p., Iron Saw Frame, Three Block Carriage, 2 good Saws, Double Edger and Trimmer good as new, Slash Chain, all in good running order, run this season; size of Mill, 30×100 ft.; good Boiler House, Blacksmith Shop, House, Barn, etc.; 400 acres of good Birch and Hemlock, also thousands of acres of timber near by. For particulars, address ALLEN CRESSMAN, Berlin, Ont.

### THE BARBADOS MARKET.

The Barbados lumber market is thus reviewed by Messrs. Clairmonte, Mann & Co. in their report dated August 18th:

The only arrival of lumber within the past fortnight was the cargo per Andrew Burnham, from Newfoundland, which sold as follows: 35 M. feet white pine boards at $18.60, 4 M. feet spruce boards at $13.60, 23 M. feet white pine at $18.83, 17 M. feet spruce at $14.13, 5 M. feet birch at $14.14, and a small quantity of scantling at $12.60. The demand for both white pine and spruce is good. Last sales of Nova Scotia lumber have been made as follows: White pine boards, $23; planks, $17.60 for first quality and $17.30 for second quality; spruce at $17.50 for first quality. Pitch pine sells at $21.11 for merchantable, $15.51 for refuse, and $13.51 for second quality.

Last sale of Gaspe cedar shingles was at $3.83 to $5.27 per M., according to quality. Cedar laying sells at $2.60 and spruce laying at $2.30.

### CURRENT TRADE CONDITIONS.

ONTARIO.

The trade of the month now drawing to a close has been larger in volume than any August for several years past. While orders have not been as plentiful as in the spring season, yet the volume of lumber moved augurs well for a heavy fall trade. Competition in buying is very keen, and it is a singular fact that retail prices have not advanced in proportion to the higher prices asked by manufacturers. The result of this is that dealers are doing business on a small margin of profit. While most of the dealers are prepared to hold their stock at a price which would give a reasonable profit, others indulge in cutting prices and accepting a margin of profit of about 50 cents per thousand. Take, for instance, 2×10 and 2×12 pine plank, for which manufacturers are asking $11 and $12. For this stock it is impossible to obtain more than an advance of 50 cents or one dollar on this price from retail dealers in Toronto. The retailer and consumer are benefitting at the expense of the wholesale dealer. This fact serves to illustrate the necessity of some organization among the lumber trade by which a basis of prices would be fixed. Report is still heard of the scarcity of hardwood lumber, and in some instances substitutes are being sought for.

The completion of buildings is creating an increased demand for shingles, of which there is but a limited stock at the mills. It is probable that an advance in prices will take place at an early date. Lath is scarce and in good demand.

QUEBEC AND NEW BRUNSWICK.

As the season advances the position of manufacturers in Quebec and the maritime provinces continues to strengthen. There are many enquiries in the market for lumber for fall shipment, but few of the mill owners are in a position to enter into contracts, having disposed of their season's production. A considerable quantity of lumber and shingles is being shipped to the United States, where prices are steadily advancing. The advance in lumber in New Brunswick is well illustrated by a recent transaction. Last spring a dealer purchased 1,500,000 feet of deals at Hopewell Cape, paying $7 per thousand. He is now reported to have sold this stock at $10 per thousand, making a profit of over $4,000 on the transaction.

Foreign orders represent no small volume of trade. Vessels are constantly sailing for British ports, while a bark has just loaded at St. John for Australia, and another for South America. Indications point to a further advance in spruce deals.

MANITOBA AND BRITISH COLUMBIA.

Harvesting operations in Manitoba and the Northwest are now engaging the attention of farmers. The government crop bulletin shows a most satisfactory yield, and the first shipments of new wheat have already been made. In anticipation of a large demand for lumber by farmers this fall, retail dealers are stocking up quite liberally, as is shown by the large quantity of stock that is being shipped from Winnipeg. Prices on lumber remain unchanged, although lath has been advanced 50 cents per thousand. In British Columbia the mills are unable to fill all the orders, the requirement for mining purposes being very heavy. Over 1,000,000 feet of lumber is being used in the construction of a flume in connection with the Grand Forks smelter.

UNITED STATES.

The only change in the United States market is a further hardening of wholesale prices at eastern points. Dealers in the Lake Erie markets have been unable to accumulate stocks as rapidly as desired, and consequently have decided to mark up prices. This has also been necessary in order to keep pace with the upward tendency at producing points. The advance in the eastern markets has been most pronounced on white pine. At Buffalo thick fine common has advanced $5 within a short time, while inch mill culls now sells at $14.50. The advance in box averages $1.50, 1×4 now being quoted at $14 and thick as high as $17.50. Inquiries for lumber have been so numerous from the east that many dealers are of the opinion that it would be better to hold the stock until the fall, when still higher prices are expected to rule. Hemlock and spruce have also improved, the former selling in the New York market on a basis of $15 per thousand.

The course of the hardwood trade is being watched with much interest. There are some dealers who anticipate a reaction, but the general opinion is that prices will not weaken before next spring at any rate, as the bulk of the consumption is for manufacturing purposes, and this branch of commerce is in a most healthy condition. Ash is very scarce throughout the eastern market, and implement manufacturers are substituting maple therefor. The scarcity of elm and basswood continues.

It is somewhat difficult to give a fair

review of the shingle market. Some of the dealers report a large stock on hand, while others have a very small supply and are in the market to buy all they can find. An advance of 15 cents over the July price list is announced, which places 18-inch at $3.85 and 16-inch at $3.40. Red cedar shingles are selling about 20 cents per thousand less than pine.

FOREIGN.

The imports into Great Britain from Canada have been heavy of late, but from the north of Europe ports the reverse is the case, due to the extraordinary position of the freight market. A state of things similar to that now existing has not been known for years. Every class of vessel has been called into requisition to supply the demand, and the natural result is high rates of freight. This has caused a further strengthening of the lumber market. At a recent sale held by Churchill & Sim, London, Eng., waney pine timber sold at high values, but square pine and birch planks scarcely realized average quotations. Spruce deals are experiencing a steady consumption. At Manchester £7 2s 6d to £7 5s is being asked for large lines ex ship, and there is every prospect of a further increase in price. Concerning the Liverpool market a correspondent writes as follows: "The spruce market is very stiff, and no signs of relaxation are apparent up to the present time; nor do we see why any such hopes should be entertained. The season for shipping from the St. Lawrence ports is drawing to a close, and with it the rates of freights and insurance will increase. This serves to strengthen the position of shippers.

## STOCKS AND PRICES.

G. Elias & Bro., of Buffalo, are said to be negotiating for the purchase of a hardwood limit in Canada.

The city of Toronto recently invited tenders for the supply of a quantity of oak and elm timber. Only one tender was submitted, and the council have not yet let the contract.

Prices at Philadelphia have advanced within the past fortnight. Hemlock sells at $14 to $14.50, 8 and 9 inch spruce at $17 and $19, and 8 inch and under boards, up to 20 feet, at $17.

The Bonny River Lumber Co., who recently acquired the Todd property at Bonny river, Charlotte county, N.B., expect to get out this winter about 5,000,000 feet of logs. The mill, which has been idle for some years, is now being repaired.

Very little lumber is on the wholesale market at Duluth. A price of $9.25 is said to have been refused for some No. 4 boards, but the greatest advance pertains to lath. One year ago lath was selling in the Duluth market at 75 cents and $1. To-day quotations are $1.60 and $2.

A report from Ottawa, dated Aug. 21st, stated that there were at the Cascades, on the Gatineau river, about 15 miles from Ottawa, the largest number of logs that has ever been got together in one mass. Owing to the lateness of the spring and consequent high water, the lumbermen of the Gatineau could not start their run until very recently. When they did start they placed 240,000 logs in the river within ten days, with the result that there gathered at the foot of Little Cascade rapids 130,000 saw logs, 70,000 railway ties, 7,500 pieces of cedar, and 5,000 pieces of timber. The logs were 25 tiers deep, and beneath these runs the river at the rate of 25 miles an hour. It is proposed to use dynamite to break this jam.

It was recently recorded that the Saginaw Lumber & Salt Co. had purchased 3,000,000 feet of Canadian logs cut on exempted limits. It is now learned that the company has purchased 2,000,000 feet more, making a total of 5,000,000 feet to be rafted to the Saginaw river this season. The price paid for these logs was the highest ever given for Canadian logs.

Following is a comparative statement of timber, &c., measured and culled at Quebec to August 29th, 1899:

| | 1897. | 1898. | 1899. |
|---|---|---|---|
| Waney white pine, cu. feet. | 3,345,989 | 1,606,257 | 1,598,665 |
| Square white pine, cu. feet. | 736,022 | 1,208,761 | 543,889 |
| Red pine, cu. feet | 145,638 | 216,538 | 159,541 |
| Oak, cu. feet | 1,250,021 | 844,206 | 487,604 |
| Elm, cu. feet | 657,536 | 471,077 | 446,408 |
| Ash, cu. feet | 128,018 | 34,532 | 56,514 |
| Basswood, cu. feet | 55 | | |
| Butternut, cu. feet | 673 | 955 | 60 |
| Tamarac, cu. feet | 348 | | 415 |
| Birch and Maple, cu. feet. | 230,561 | 106,592 | 231,946 |

There promises to be great activity in logging operations in the districts north of Bobcaygeon and Lindsay. M. M. Boyd & Co., of Bobcaygeon, will operate on about the same scale as last year, and will have one large camp on their Glamorgan township limits. McCormack & McLeod will have two gangs on Trout creek, Muskoka, and are already cutting cedar in Haliburton county. The Dickson Co., of Lakefield, will make a large cut on the old Scott limits in Cavendish and Anstruther. The Gilmour Company have sent a gang of men into Harvey township, about eight miles from Bobcaygeon. It is the intention to clean up this limit, taking off all the pine, cedar, hemlock, birch and elm. Turner & Fisher, of Saginaw, will have four camps in Muskoka and Georgian Bay limits, and the Rathbun Company will operate extensively in Muskoka and Haliburton.

## BRITISH COLUMBIA LUMBER SHIPMENTS.

The shipments of lumber from British Columbia to foreign countries up to July 31st of this year were as follows:

| Name of Vessel. | From. | For. | Cargo—Ft. |
|---|---|---|---|
| John Smith | Chemainus | Cape Town | 626,856 |
| Coloma | " | Tientsin | 700,497 |

## THE AUSTRALIAN LUMBER MARKET.

Messrs. Fraser & Co., of Melbourne, in their last monthly report, review the Australian market as below:

Sales of timber during the past four weeks have been of a moderate character, few important operations having been made from stocks in the yard and "ex wharf." In no line, however, has there been a decline upon last rates; while in some instances slightly better prices have been asked and secured, and for several descriptions of lumber there are indications of better value being shown at no distant date. There are signs of an improvement in the demand from the country districts when the spring season opens, also at which time there will most probably be an increase in the town and suburban orders, as many contracts for building requirements have lately been arranged to commence operations very shortly; and as further local contracts are now in view to be concluded within the next few months, we are, therefore, hopeful of seeing in the near future a much improved demand for all classes of timber, and for an actual consumption of the same.

SPRUCE AND BALTIC WHITE DEALS.—Imports: Nil. Some further business, but of a limited extent, has been done in stocks at 2⅝d per foot of 9 x 3 for an assorted specification.

OREGON PINE.—Imports: Nil. The trade having been well supplied out of the last cargo per Hawaiian Isles, consequentiy there has been but little business done in the past four weeks. Some small sales have been concluded at from £6 to £6 5s per 1000 feet super., upon which basis the market is firm for the remainder of supplies at the wharf.

SHELVING AND CLEAR PINE.—Imports: Nil. £8 10s is now required for shelving, at which figure some sales have been concluded. Michigan clear pine is in poor demand at £14 10s per 1000 feet super.

## LUMBER FREIGHT RATES.

CANADA ATLANTIC RAILWAY.

Lumber freight rates on the Canada Atlantic Railway, according to the summer schedule effective April 1st, are as follows: Ottawa, Rockland, Hawkesbury and intermediate points to Toronto, 10 cents per 100 lbs.; Parry Sound to Toronto, pine 10 cents, hardwood, 11 cents; Ottawa to Oswego, $1.90 per M ft.; Ottawa to Syracuse, $2.20 per M ft, (3,000 lbs. and under per M ft.); Ottawa to Montreal, $1.00 per M feet, lath 20 cents per M pieces; Quebec, $2.00 per M feet, lath 40 cents per M pieces; Arnprior to Montreal, $1.50 per M feet, lath 30 cents per M pieces; Quebec, 12 cts.; Pembroke to Montreal, $1.75 per M ft., lath 35 cents per M pieces; Quebec, $2 75 per M ft., lath 55 cents per M pieces; Ottawa to New York, $3.00 per M ft., lath 55 cents per M pieces; Arnprior to New York, $3.50 per M ft, lath 65 cents per M pieces; Pembroke to New York, $3.75 per M ft., lath 70 cents per M pieces; Parry Sound to New York, $4.00 per M ft., lath 80 cts per M pieces; Ottawa to Buffalo, 12 cts. per 100 lbs.; Ottawa to Port Huron and Detroit, 14 cents per 100 lbs.; Ottawa, Rockland and Hawkesbury to Boston and common points, local 15c.; exports 11c. per 100 lbs.; Arnprior to Boston and common points, local 17 cents, export 15 cts. per 100 lbs.; Parry Sound to Boston and Portland and common points, local 21½ cents, export 20 cts. per 100 lbs.; Ottawa, Rockland and Hawkesbury to Portland, &c., 15 cts.; Arnprior to Portland, 17 cts.; Ottawa to Burlington, 6c. per 100 lbs.; Ottawa to Albany, 10 cts. per 100 lbs.; Arnprior to Albany, 12 cts. per 100 lbs.; Parry Sound to Albany, 17 cts. per 100 lbs.; Ottawa to Scranton and Wilkesbarre, Pa., also Binghampton, N.Y., 13 cents per 100 lbs, from Arnprior 15 cents, from Parry Sound 20 cents per 100 lbs.; Ottawa to St. John, N.B. and common points, 20 cents per 100 lbs.; Ottawa to Halifax, N.S., and common points, 21 cents per 100 lbs. Minimum carload weight for shipment of lumber, lath, shingles, etc., is 30,000 lbs., and rates quoted above are in cents per 100 lbs., except when quoted per M ft.; minimum carloads 10 M ft., lumber not exceeding 3,000 lbs. per M ft.; lath 50,000 pieces, not exceeding 600 lbs. per M pcs. Ottawa rates apply on shipments from Rockland and Hawkesbury.

### COOPERAGE PRICES.

The Sutherland Innes Company, manufacturers of cooperage stock, Chatham, Ont., in a letter to the CANADA LUMBERMAN, give the following information regarding the cooperage market :

There has been a considerable advance in cooperage stock, and the markets of the United States during the past 60 days have advanced rapidly. The following is our new price list f.o.b. cars : No. 1, 28½" jointed elm staves, $5.75 per net 1,000 ; No. 1, 30", $5.75 ; No. 2, 28½", $4 ; No. 2, 30", $4. Millrun, 5 to 2", $5.25 ; 6 to 2", $4.75. No. 1, 24" jointed elm staves, $4 ; No. 2, 24", $2. No. 1, 14" to 14¾" kiln dried basswood heading, 3½c per set ; No. 1, 15" to 16", 3½c ; No. 1, 17⅛", 4¼c. Millrun, 17⅛", $3.75 per 100 sets ; No. 2, 17⅛", $3.50 ; No. 1, 18" to 18¼", 4½c per set ; No. 1, 19⅛ in., 4¼c ; No. 1, 19½ in., 5c. A No. 1, 4½ ft. patent elm hoops, $4.60 per net 1,000 ; No. 1, 5½ ft., $6.50 ; No. 1, 6 ft., $6.75 ; No. 1, 6½ ft., $7 ; No. 1, 6' 9 in., $7.25. 12 in. liners, 40c per 1,000. 13 to 18 in. liners, 50c per 1,000. 34 to 35 in. syrup barrel staves, $18. 30 in. half syrup barrel staves sell at $16 for straight, and bent stock $2 per 1,000 more.

These are the prices that we are selling at, but it is quite possible that with the large advances that have taken place in the United States we may be compelled to advance our figures, particularly for Canadian business, to cover the advance that has taken place in lumber, timber and wages.

### SALE OF CANADIAN TIMBER.

Messrs. Churchill & Sim, London, Eng., held an auction sale of wood goods on August 16th, at which Canadian timber sold as follows:

SPRUCE.—Ex St. John city, from Quebec—12 ft., 3 x 9, third quality, £7 10s. and £7 15s. Ex Yola, from Montreal—12-13 ft., 3 x 9-11, second quality, £8 10s.; 12-13 ft., 3 x 7-9, third quality, £7 15s. Ex Euxinia, from Quebec—13 ft., 3 x 9, third quality, £7 15s. Ex Ormiston, from Quebec—6-13 ft., 2 x 7-10, unassorted, £7 5s.

OAK TIMBER.—Ex Kirriemoor, from Quebec—651 cubic ft. at 5s. 5d. per load, 552 cu. ft. at 5s. 10d., 397 cu. ft. at 5s. 10d., and 458 cu. ft. at 5s.

BIRCH PLANKS.—Ex St. John City, from Halifax—7-17 ft., 5 x 6 in., 1s. per cubic foot ; 7-16 ft., 3 x 10-12 in., 1s.; 4-18 ft., 3 x 9 in., 1s.; 6-20 ft., 3 x 8 in., 11d.; 10-17 ft., 3 x 7-8 in., 10½d.; 8-13 ft., 3 x 6-10 in., 9s. ½d.; 8-18 ft., 2½ x 11-15 in., 1s.; 9-17 ft., 2½ x 3-12 in., 1s.; 4-17 ft., 2 x 9-16 in., 1s. 1d.; 3-19 ft., 1½ x 1¾ in., 1s. 1d.

PINE TIMBER.—Ex Krim, from Quebec—24-26 ft., 16-30 in., first class waney, 97s. 6d. per load ; 18-20 ft., 16-26 in., 92s. 6d.; 23-25 ft., 16-21 in., 92s. 6d. Ex Fernmoor, from Quebec—36-39 ft., 13-17 in., first class square pine, 92s. 6d. per load ; 39-34 ft., 14-16 in., 54s.; 42-47 ft., 14-17 in., 58s.; 20-29 ft., 14-23 in., 59s.; 20-27 ft., 14-22 in., 55s.; 32-40 ft., 12-20 in., 60s.; 29-32 ft., 12-16 in., 57s.

### THE SHINGLE SITUATION.

During the current season of constantly advancing prices, shingles of no kind have responded to increased values at any such rate as have all kinds and qualities of lumber. The explanation of this is that the immense consumption of lumber throughout the country for the year has been required more for manufacturing enterprises than for building operations.

It is not to be inferred from this that there has not been a large demand for shingles throughout the season The sales, says the American Lumberman, have far outstripped any former year. The Washington mills, without one exception, are way behind their orders, and it would doubtless be impossible for an eastern dealer, on a present order, to receive shingles in time for his fall trade. The stocks of pine shingles in the northwest are extremely low, and those of white cedar probably not more than one-half those of a year ago. New Brunswick cedars coming into the eastern field are in short supply. The same can be said of Pennsylvania hemlock shingles and the cypress shingles of the south.

In the face of the foregoing facts, it can safely be prophesied that shingles are a purchase at current values, as it is almost certain that a sharp advance in prices will be instituted within a very short time.

| 34 in. to 35 in. elm syrup bbl. staves | 18 00 |
| No 1 30 inch half syrup barrel staves | 16 00 |

(If bent to shape, $2.00 per thousand more.)

## HINTS ON BOILER STEAMING.

By George W. Hotchkiss.

Would you suppose that the cracks in the brick base wall of a chimney stack would have any perceptible influence upon the draft? This was the question asked me by the manager of a large saw mill, as we walked about the premises, and proceeding, he said: "Here for many years we have run a battery of eight boilers, and until within a couple of years have had no trouble to keep up all the steam we required, but about two years ago we began to have trouble." About that time you put in the band saws, I suggested. "True," said he, "but that was not the trouble, or at least the whole of it; in looking for it we came to notice that the brick part of the stack, which as you see is about twelve feet square and twenty high, had a number of large cracks in it, and concluding that this had something to do with causing the trouble with the draft, we set the mason at work and filled them up; this made considerable difference, but did not fully cure the evil, and we began another hunt, and finally found it in our methods of firing. Our boilers were fired with sawdust fed by carriers, which delivered the sawdust in large heaps on the grates, so we had a smothered fire all the time, which prevented the blaze from reaching the fire sheets; this had been our custom for years, and we had no trouble, but in those days we had green sawdust of the coarse character produced by our circular saws. Of late, by reason of the forest fires which compelled us to cut our timber to save it, our stocks have been more largely of old logs which have lost their pitch through lying in the water so long, and the sawdust is therefore less inflammable while more water-soaked; of course, the finer sawdust of the band saws made considerable difference, and this we strove to overcome by burning more slabs. But we did not reach the seat of our trouble until we adopted a new system of firing. Just take a look into this fire box; observe how clean and intense the blaze, and the grates are almost clean; you can see every part of them; here was the trouble with our draft; we had been trying to make steam with smothered fire. We have had no trouble since we began to feed the sawdust only so fast as it would burn; where we formally used eight or ten loads of slabs with the sawdust, we seldom use any after we get the fire started in the morning and the grates well heated; a couple of waggon loads of slabs is about all we use in the day's run."

Here is a hint for sawmill men who have trouble with their draft. Don't try to keep too heavy a body of fuel, especially sawdust, on your grates. A quick blaze under the fire sheets is better than a large body of dead smoke. The sawdust from a band saw being so much finer than that from a rotary, unless the grates are very fine in the mesh, there should be a mixture of fine wood with it, and here is where the "hog" is of great utility, converting the slabs and edgings into just the proper size to aid the finer sawdust and intensify its flame. Mix them together with a shovel on the hearth, or with carriers if you feed automatically, not allowing too large an accumulation on the grates, and my word for it, you will get rid of the largest cause of the trouble in keeping up steam.—Lumber Trade Journal.

The Gilmour Company, of Trenton, Ont., are rebuilding their dam on the Scootamatta river.

## QUESTIONS AND ANSWERS.

"(1) In log run, can a buyer measure out the defects; if so, to what extent? (2) If there are two or more splits in the end of a board, can a buyer measure them out; if so, in what grade? (3) In purchasing a lot of elm logs "log run," can the hearts be measured out if they are not sawed out? (4) Should it be necessary to give the manufacturer orders to saw the hearts out? (5) Are there any persons appointed by the government or by the Lumbermen's Association for the inspection, grading and measuring of lumber?"

To the above questions we have received the following replies: (1) No; if defects were not of such a nature as to throw the board into mill culls it should be accepted at its full measure, unless it was reduced for bad edging, barky or waney, for instance. (2) If the splits are straight and do not extend more than two feet from the end of the board, and the board is not less than 10″ wide, the board should be accepted in No. 1 grade. (3) A dealer has no right to measure out the heart unless it is specially agreed that he do so in scaling the logs. Hearts, as a rule, are always sawed out of hardwood by manufacturers. This is seldom or ever done with pine, hemlock or spruce. (4) If the logs were hardwood I do not think it should be necessary to give orders to have the hearts cut out. It has always been the custom to cut out the hearts unless instructed to leave them in the lumber. This rule should be reversed in manufacturing pine, hemlock or spruce. (5) There are no government inspectors in Canada, and every manufacturer makes his own inspection.

## COST OF POWER IN BOX FACTORIES.

We too often hear the remark made that power in a box factory costs nothing.

We thoroughly agree with the above when the box factory is a shook factory, and the same is located in the woods or adjacent thereto, where slabs, kindlings, shavings and sawdust are a nuisance and a drug, and absolutely valueless as a money producer. But when the box factory is located in the heart of a large city, power is worth something, in fact is worth a great deal. Because the kindling wood brings a big price, sawdust and shingles are burned, and are usually referred to as nothing of value.

The shaving press is now an established fact around a box plant, and what it means towards the solution of the sawdust and shavings problem those alone know who have used the press.

The uses for fixed sawdust and shavings are many, but one thing above all else are they good for, viz., insulating ice-houses. We know this to be a fact.

As to the value of shavings as a fuel, compared with coal. On a three days' continuous test the following facts were learned, viz., that 8,000 pounds of baled shavings at $2.50 for 2,000 pounds, or if bales are full weight, 12½ cents a bale, in other words. $10, with the aid of an extra fireman at $1.50 a day, will produce steam about equivalent to three tons of soft coal at $3.90 a ton, $11.70. In other words, a ton of 2,000 pounds of shavings at $2.50 is worth practically three-fourths of a ton of coal at $4.00.

Where a man can dispose of shavings at 15 cents a bale, he can better afford to buy coal and sell his baled shavings and sawdust. In large cities the progressive, alert box man does not boast that his power costs nothing, aud when thinking of putting in machinery the question he first asks is, "How much power does it take?"

A machine that daily uses 40 h.p., taking it from an engine with a capacity of say 100 h.p., that machine costs in dollars and cents to run through the year $1,440.00 on a basis of $4.17 coal, ten hours a day for 309 days. Every horse-power added to a plant, when a market can be had for fuel and shavings, means outlay. The shavings and saw dust may cost nothing, but they are worth, like any other commodity, what they will fetch.

The failing of the average box man when making up estimates is to repeatedly refer to this and that as "costing nothing." Every movement of the men, every turn of the saw, every stick of waste costs something and represents some value in material and time and labor expended upon it, all of which gets into the pay-role and expense account.

If box men realized, concludes Charles Cristadoro in the Barrel and Box, that to turn a board over costs money, many items of expense now ignored as too trifling for account would be considered and duly charged for.

## TAMARAC WANTED.

The Ontario Forestry Department has received a letter from the Imperial Institute of London, England, replying to the enquiry made some time ago as to the possibilities of developing a lucrative export trade in tamarac between Canada and the mother country. The letter states that gum of any kind is practically unknown in England, gum-chewers being confined to Canada and the United States. But there is a good demand for tamarac for medicinal purposes, and a number of British importers have evinced a desire to see some samples of Canadian tamarac. Mr. Southworth is collecting samples and will forward them in a few days. He is also sending over some specimens of the Canadian shumach, which is used largely in England for tanning purposes. At present the European market is supplied by Sicily, and even Toronto firms secure their shumach from there. But in the Ontario north country there are large quantities of shumach cumbering good agricultural land and which is of no use whatever to settlers. Mr. Southworth sees no reason why these apparently useless bushes cannot be turned into a profitable staple of export.

## GERMAN METHODS.

There are no factories in Germany where cheap furniture is produced; it is made in small quantities at the workshops of individual joiners, who are supplied by wood-working establishments with the different parts in an unfinished state. These joiners work at a very cheap rate. It may pay American manufacturers to export high-class articles of wooden furniture to Germany, provided these are tasteful in design and superior in finish to those made in Germany. They should be of superior workmanship and solidity, and, if anything, somewhat cheaper in price than similar articles of German make. It must be taken into account that such American furniture will have its original cost price increased by about 20 per cent. of the selling valuation here, owing to the cost of packing, freight, insurance, and the German import duties.

# THE NEWS.

—Mr. James McLean, of Bryson, Que., is erecting a large sawmill at Fort Coulonge.

—Mr. Wm. Beatty, planing mill, Harriston, Ont., has been succeeded by Mr. J.E. Merriam.

—Mr. J. C. Shields, of Ashcroft, has selected a site at Kamloops, B.C., for a sawmill, and will commence work at once.

—Mr. H. H. Drake, of Red Deer, N.W.T., is moving to Innisfail, where he will establish a sawmill and lumber yard.

—Messrs. Donald Fraser & Son, of Fredericton, N.B., have completed a new sawmill at Calhoun, on Lake Temiscouata.

—The new Hastings sawmill at Vancouver, B.C., started up last month, having been rebuilt in a most substantial manner.

—Mr. Arthur P. May, timber merchant, of Vancouver, B.C., has made the first importation of Australian hardwood into that province.

—The Canadian Pacific Lumber Co., of Port Moody, B.C., have established yards at Vancouver, under the management of Mr. J. McLellan.

—Mr. Josiah Watson has purchased the Coleman sawmill and stave factory at Seaforth, Ont., and is having the establishment thoroughly overhauled.

—On Saturday, July 19th, the employees of the James Robertson Manufacturing Co., of Toronto, enjoyed their annual excursion to St. Catharines.

—The Wm. Tyler Lumber Company, of Vancouver, B.C., are making extensive alterations and improvements to their mill, including the building of dry kilns.

—Mr. John A. Christie, late manager of the Assiniboine Lumber Co., of Brandon, Man., has gone to British Columbia, with the intention of taking up his residence there.

—The sawmill of R. & W. Conroy, at Deschenes Mills, Que., which was destroyed by fire on July 7th, was valued at about $125,000, the capacity being 175,000 feet per day.

—The Roxton Novelty Chair Company, of Roxton Falls, Que., has been incorporated, to manufacture furniture, chairs, etc. Wilfred Wood, of Roxton Falls, is interested.

—Messrs. J. W. Shannon & Co., of Prince Albert, N.W.T., have put in a saw and planing mill plant on timber limits secured by them 20 miles north on the Sasketchewan river.

—The sawmill of the Rathbun Company at Tweed, Ont., closed down for the season recently, having cut 47-000 railroad ties, 135,000 feet of lumber, and 475 cords of slab-wood.

—The Brunette Sawmill Co., of New Westminster, B.C., are about to increase the capacity of their mill and build a planing mill and dry kilns. Mr. Lewis is manager of this company.

—The sawmills and yards of McLaren & McLauren at East Templeton, Que., are now lighted by electricity, a 500 light plant having been installed by Gariock & Goddard, of Ottawa.

—It is reported that the extension of the Atlantic & Lake Superior Railway to Gaspe Basin, Que., is to be entered upon immediately. The road will pass through immense spruce forests, which will thus be opened up.

—The United States Consul General at Montreal, in a recent report on the forests of Canada, estimates the area under timber in the Dominion at one and one-quarter million square miles, or over 37 per cent. of the total area.

—Statistics show that Canada imported from the Southern States during the six months ending June 30th, 1899, 628,000 feet of sawn timber, 9,022 cubic feet of hewn timber, 12,000 feet of boards, and manufacturers of lumber to the value of $6,736.

—Mr. J.G. Scott, manager of the Pacific Coast Lumber Co., New Westminster, B.C., reports a very satisfactory trade in red cedar lumber and shingles for the first seven months of this year. The shipments have exceeded those for the whole of last year.

—Work is being rushed on the calcium carbide factory now adjoining the mill of the Bronson-Western Lumber Company at Ottawa. The main factory will be built entirely of stone and steel, and will be five stories high, its dimensions being 276 × 79 feet. The entire plant will cost $225,000, and it is expected that it will be in operation by the first of the year. The works will run day and night and will give employment to over one hundred men.

—The Sturgeon River Improvement Co. is the title of a new concern, consisting of J. R. Booth, Wm. Anderson, C. J. Booth, J. F. Booth, Ottawa, R. Booth, Pembroke, A. A. Young, Cache Bay, and A. G. Browning, North Bay. The capital is $18,000.

—Mr. J. R. Eaton, of Orillia, Ont., has completed a large addition to his mill, increasing its capacity by about one-third. Several new machines have been added and an additional dry kiln erected. He has commenced the manufacture of doors for export.

—As already announced, the Rat Portage Lumber Co. have in view the erection of a large sawmill at Winnipeg. Should the South Eastern railway be completed to Rainy River this year, the erection of the proposed mill will be commenced immediately, otherwise it will be delayed until next year.

—Messrs. A. L. & D. G. Mackay, loggers, of New Westminster, B.C., are managing a logging camp at Tipella, at the head of Harrison Lake. They report that there are excellent limits back of Tipella. So far the timber has been rather inaccessible, but the trail has enabled the loggers to get out about 5,000,000 feet.

—An exchange states that Mr. J. H. Veno, a mill man of extensive experience, is negotiating to obtain possession of several hundred acres of cedar timber limits lying about two and one-half miles from the Fraser river, in British Columbia, and accessible by a trail to shipping. Mr. Veno is understood to have an option on the property.

—Mr. D. C. Cameron, manager of the Rat Portage Lumber Co., states that they have been delayed in opening their yard at Brandon, Man., owing to their mills being crowded with orders. The scarcity of men has been a great drawback, and a short time ago a representative of the company went to Montreal to engage one hundred men.

—Mr. D. Mann, of the firm of Mackenzie & Mann, Canadian railway contractors and promoters, recently sailed from Vancouver for the Orient. It is said that the firm have been offered contracts for building two lines of railway in China, one from Shanghai to Nankin, a distance of 250 miles, and the other from Hankoo to Shangtu, some 600 miles.

—Mr. David Richards has just completed a fine sawmill at Richardville, N.B. The main building is 150 × 35 feet, equipped with gang and rotary, re-saw and edger, manufactured by Carrier, Laine & Co., of Levis, Que. In the wing of the building, 65 × 30 feet, are situated three shingle machines, a clapboard machine and planer. The engine house is built of solid brick, with galvanized iron roof. The capacity of the mill is 55,000 feet of lumber per day.

## PERSONAL.

The death is announced of Mr. C. W. Crawford, sawmill owner, of Westfield, N.B.

Mr. John McLean, of the firm of McLean & Son, sawmillers, Wingham, Ont., recently had the misfortune to break one of his legs.

The sympathy of many friends has been extended during the past month to Mr. Geo. Niebergall, the well known lumberman, of Staples, Ont., upon the death of his wife.

The Department of Crown Lands at Toronto was recently advised of the death of Mr. John Crowe, a wood ranger in the Rat Portage district, who was drowned in the Mimikon river.

Mr. R. E. Gosnell, who for years was Provincial Librarian for British Columbia, and who about two years ago compiled a valuable work entitled "The Year Book of British Columbia," has entered the ranks of journalism, having purchased the Greenwood, B. C., Miner. Mr. Gosnell is an able writer, and we predict for him a high degree of success in his new field.

The Dominion Government has established a Bureau of Forestry in connection with the Department of Interior. Mr. E. Stewart, of Collingwood, has been appointed chief inspector. Mr. Stewart is a land surveyor, and while engaged in the practice of his profession gave much attention to the various woods of this country. He is said to possess a knowledge of forestry which well fits him for his present position.

## TRADE NOTES.

Messrs. Baldwin, Tuthill & Bolton, of Grand Rapids, Mich., are sending to their friends and customers a circular enumerating a number of causes for the cracking and breaking of saws, and calling attention to their 290 page manual on saw-fitting. Every saw-filer should have a copy of this manual.

The Victoria Lumber & Manufacturing company, of Chemainus, B.C., have just given to the Wm. Hamilton Manufacturing Co., through their Vancouver agency, the contract for the machinery to complete their mill to make it a double header. This was the original intention when the mill was built, but in the past only one end has been operated. Now Mr. Palmer, the energetic manager of the company, has decided to increase the output by fitting up the balance of the mill. The work is expected to be completed by December.

## CUTTING UP BOX STOCK.

THE process of cutting up stock involves the nicety of judgment which can only come from a natural talent developed by more or less experience. In one factory which I lately visited, the head of the cutting-up department had been with the concern for twenty-five years, and for a large portion of that time in his present position. Some of his men had been with him nearly as long, and every one in his department had been educated under his eye. It is really astonishing what results can be produced by the right man at the cutting-up saw, in the way of economy of stock; and, on the other hand, it is astonishing how much loss can be made in the same place, with no one in the shop really able to point out just exactly how it can be avoided. The man at the cutting-up bench can knock off a large amount of profit without any one but a thoroughly practical man in his line being able to tell how he does it.

In some shops, one man cuts up nothing but stock for one kind of boxes at a time, and only a part of the stock for one box, at that, say, for instance, the sides, top and bottom, or those parts which are all of one length. This involves more or less extra handling of a certain amount of the stock, for it is not possible ordinarily for a board to be all cut into one length of stock without waste, unless the board is sound enough so that the whole length can be used. Therefore, when a man cuts only one length, in order to save material, he must pass a part of his board to another cutter, who cuts something of a different length, shorter or longer.

In one factory which I lately visited, where there were a large number of cutting-up saws in operation at once, each man cut several different lengths, cutting for several sizes of boxes at the same time. Even then it occasionally occurred that he could not use all the board economically. In such cases, the piece was carried automatically to another cutter, whom he knew could use it to advantage, or at least a part of it, and he, in turn, if necessary, could pass the rest along to another cutter. I honestly believe that the greatest chance for a leak in the making of a box is right here, at the cutting-up benches, and that a good many box makers do not realize it, because they are not themselves experts in that particular branch.

There is where the sawing of waste in material should be made, more than at any other stage in the making of a box, and the amount of refuse that the really first-class cutter will leave in a day in one of the large factories is really remarkably small. Of course, this results, to a large degree, from the fact that in a large shop he has so many different sizes to cut to. For instance, I was in a shop, not long since, where they were making, simultaneously, seven different sizes of boxes, for one packing house at the Chicago stock yards, and this did not include a number of different sizes of boxes for canned goods, which they were making for the same concern. The seven sizes of boxes were all coarse, cheap things for bulk meats, cured in different ways, including boxes for shipping cooked hams and cooked corn beef, not in cans, but in the whole piece, to retail dealers in the city and country within a reasonable distance. Taking note, afterwards, I saw several of these boxes at a railway station, waiting for the express train. They were not made with tight joints on the sides, bottom or top, but with solid ends. They were little better than an extra tight crate, with a hand hole near the top of each end for handlers to carry them by. Each box contained a certain number of real hams or "picnic" hams, or pieces of

corned beef, all thoroughly cooked and ready to slice for the table, and each ham or piece of beef securely wrapped in one or more thicknesses of heavy brown paper, so as to be safe from flies or dust.

In the factory of which I speak, several sizes of these boxes were made to suit the size of the retailers' orders, and, from these boxes up to a large heavy pork box, for holding dry-salted pork, all were being made at the same time. It may be noted here that the size of the box often has something to do with the quality of the lumber used, and, such is the range in quality, unless a piece of board has a large, loose knot in it, or some other kind of a hole or a rotten piece too soft to hold together long enough to safely carry its contents to some distance, little or nothing of it is wasted in the making of the larger or coarser boxes. So, when a board comes to the cutting bench, it takes but a glance for the cutter to decide what to put his first cut into. If he has a clean, solid piece he can cut off without involving waste in the next cut, he takes off for some size or quality of box requiring that kind of stock.

The next piece may be too poor to accompany the first piece, or there may be a loss on it, or a spot that must be cut out. But, even in this respect, the cutter does not always do the cutting out, as perhaps it may be better done when the piece passes to the rip saw, to size up the sides, top and bottom of the given box, so he may leave the defective parts in, simply cutting the right length, depending upon the man at the rip saw to make it good enough for the box for which he designs it. If the cutter has not sizes enough on his list or on his orders to use up all the pieces he is obliged to make, those pieces left are sent on the carrier to some other part of the shop where they are carefully piled up and marked for future use.

Before getting thus far, I ought to have said more with regard to the thickness of stock. For instance, the bulk of the lumber bought for any box factory is sawed one inch thick, or, really, an inch and one-sixteenth, although there is a good deal cut that is barely an inch thick. Next comes stock one and one-quarter, one and one-half and two inches. The box makers buy but little over two inches thick, although occasionally some is wanted for special purposes, usually to be resawed into several thickness of thin lumber, which can be obtained in no other way. As a general rule, the saw mills make but very little lumber, suitable for the box makers, which is under one inch thick, although, in some kinds, like poplar, basswood, cottonwood and gum, the box makers get more or less of the low sortings of thin stock, cut perhaps for other purposes, but which is too poor to ship for anything but boxes. In cortonwood and gum there is, besides, considerable cut thin purposely for the box makers, but, at the same time, very much of both kinds of wood has to be resawed for the smaller and finer boxes.

I think the bulk of the one-inch lumber bought by the box-makers is used full thickness, after simply dressing. They buy the inch-and one-fourth and inch and one-half to be resawed into two, three or four thinner pieces. As I have already said, the two-inch and thicker is almost invariably bought to be resawed, but, of course, some two-inch stock, as well as some of the thinner kind, the inch and a-half and inch and a-quarter, is used for making cleats, of which more will be said later on.

To return to the regular process through which the lumber goes: It may be said that, usually, after leaving the cutting-up bench, it goes to the rip saw, where the ripper takes one, two or more pieces of the cut-up lumber side by side, rips off enough from the last piece to leave the whole just wide enough for a top or bottom or side, and, perhaps, at the same time, the pieces for the ends, putting just enough together to make the parts of the box ready to nail up.

Here, again, is a great chance for saving or losing. Where two, three or more parts are required for a side or bottom, the ripper must be able to lay his hand on a last piece that shall so nearly answer the purpose as to require the least amount to be ripped off, or else he must take a piece so wide that after ripping off what is needed for the purpose, he will have a piece left to go into the next side or whatever he is making. It also depends upon him to cut out the defective parts in the boards without wasting any of the good lumber. He may sometimes be obliged to cut out such a wide piece from the middle of the board, in order to get rid of a bad defect, in which case he sends the piece cut out back to the cut-up man to be cut over for a smaller box.

It is plainly to be seen that there must be a man of the best judgement at the rip saw bench, as well as at the cutting table; for between the two men, more than anywhere else in the mill, lies the making or breaking of the concern. Between them more than anywhere else in the shop, after the buying of stock, lies the portion of profit aud loss, provided always the man who makes the price on the finished box has figured properly.—Packages.

## SAW GRINDING.

The following suggestions are taken from the Timber Trades Journal, London. They are contributed by M. Powis Bale, M.E., author of several works on wood-working methods, and are presumed to represent the latest English practice:

For many years after the introduction of emery wheels or discs, a prejudice existed against their use for sharpening saws, and, to some extent, this prejudice still survives. It arose chiefly from the fact that many of the wheels made were unsuited to their work, and the user had little knowledge as to their proper management. In the following paper some hints will be given as to their management, which may be found serviceable to users, and although these remarks relate chiefly to emery wheels for sharpening saws, they can in most cases be equally well applied to emery wheels used for other purposes. In the first place, it is important to secure an emery wheel of good quality, and of a texture and hardness well suited to the work. This is not so simple a matter as it may at first appear, owing to the quantity of cheap, inferior wheels—chiefly of continental make—with which the market is flooded.

For saw-sharpening purposes a moderately soft wheel should be preferred, since it will cut quicker and heat and glaze less than a hard one; it will, however, wear out a little sooner. Some wheels are harder on their surface than further in, and they do not cut their best until they are worn a little, but the best class of wheels may be obtained of any required degree of hardness, as it is only necessary to vary the proportions of the compound used in their manufacture. Sometimes a good wheel will be condemned as bad when the fault may arise from its being unsuited to the work it is used for, or it may have been run at an improper speed. In establishments where a variety of work is done, it will pay well to have a fair assortment of wheels, and not make one do duty for all kinds of operations. When the wheel is secured, before mounted it should be examined to see that it is perfectly sound. This may be ascertained by tapping it lightly with a hammer; if sound it will ring, if it does not ring it should be closely examined, and if any cracks or flaws are detected, however slight, the wheel should be discarded, as it would be dangerous to work.

To lessen the chance of accidents from cracks, the manufacturers of some wheels insert in them a web or webs of brass wire, proportioned in strength to the size and weight of the wheel. They claim that the insertion of the wire does not in any way affect the cutting power of the wheel, as it wears away in advance of the emery. The wheel should be mounted so that it fits easily on the spindle, and thus have room to expand should it become warm. Large washers or flanges, say about one-third the diameter of the wheel, should be fitted on either side. These are preferably made slightly concave on their inner side, and a thin piece of packing—rubber or leather will do very well—should be placed between them and the wheel. Care must be taken that they are not screwed too tightly, as the wheels are liable to crack, especially if a little warped, and they are then, of course, exceedingly dangerous. The saw-sharpening machine in which the wheels are run should be well made and substantially built, the main frame being cast in one piece. In the best machines the emery wheel is mounted on a small steel spindle running in bearings or centers fitted in a counterbalanced swinging carriage. This carriage is brought down to the saw by hand, and, by means of a quadrant, can be set at an angle to give any desired lead to tooth; stops are also fitted to regulate the depth of the gullet and the pitch of the tooth. The countershaft is usually placed at the back of the machine, and the band (belt) giving motion to the emery disc passes over an idle pulley and then directly on to a small pulley on the emery disc spindle. In the place of single pulleys the writer strongly recommends the use of adjustable pulleys of different size, or small cone pulleys, so that as the wheel wears less in diameter its speed can be increased in proportion.

The question of speed is a factor of immense importance in the successful working of emery wheels. The best cutting speed will vary somewhat in wheels of different character; but a speed of from 4,500 feet to 5,500 feet per minute at the periphery of the disc will usually be found suitable. A speed midway between the figures, say 5,000 feet per minute for the 12-inch wheel, which is generally used in sharpening saws, may be accepted as a standard. When the wheels are worn down considerably in diameter a smaller set of side washers may be substituted.

For sharpening saws, wheels of a thickness of three-eighths to three-quarter-inch, with a diameter of 12 inches, will be found the most suitable sizes. If a deep gullet be required, a moderately coarse grit wheel should be employed, and for topping and finishing the teeth, a fine grit wheel used; the teeth should not afterward be touched with a file, as some operators will persist in doing. It will pay well to have a set of emery wheels mounted on different spindles, so that they can readily be slipped in and out of the machine. In sharpening saws, in fact in any kind of emery grinding, the pressure of the wheel on the material to be removed, or vice versa, should be light. It is a very erroneous idea that heavy pressure produces rapid cutting; it simply results in the glazing of the wheel and the hardening or burning of the teeth, which will often crumble and break at the points when in work.

The teeth of saws should never be allowed to get short and stumpy, as they will do less work and take more power to drive, as the saw has a greater tendency to bind owing to the want of sufficient room in the gullets for the sawdust to escape rapidly. If a saw has been badly kept and it is necessary to remove much metal, instead of forcing the wheel as hard as possible on the saw-plate, and making it become red or blue from the heat, the operation should be lightly repeated several times in succession. With the object of preventing the case-hardening of the teeth points, sometimes a jet of water is allowed to play on the tooth being sharpened, but with ordinary skill and care this should not be necessary.

In America deep gullets are often cut with a milling cutter arranged with an automatic feed, and a stop adjustment to regulate the depth of gullet; but if a saw be kept in proper order the use of this tool is unnecessary. The same may be said of the fly press sometimes used in this country, which, in punching out deep gullets, often springs or cracks the saw plate, and is at the best a very bad practice.

## STEAM PIPE COVERING.

A novel method of testing the efficiency of coverings for steam pipes electrically is in use. A section of the steam pipe is heated electrically by means of a coil of wire in oil within the pipe. The amount of energy necessary to keep the pipe at a definite temperature is measured. Since the energy supplied is just enough to maintain a constant temperature, it must therefore equal the heat lost from the pipe. Hence, from the electrical energy supplied the heat lost from the outside of the pipe can be calculated. The new method, which was recently described by Prof. Chas. L. Morton before one of the American learned societies, would seem to be worthy of attention.

## CANADA'S COMMERCIAL AGENTS.

Following is the official list of Canada's Commercial Agents in Great Britain, British possessions and foreign countries:

J. S. Larke, Sydney, N.S.W., agent for Australasia.

G. Eustace Burke, Kingston, Jamaica, agent for Jamaica.

Robert Bryson, St. John, Antigua, agent for Antigua, Montserrat and Dominica.

S. L. Horsford, St. Kitts, agent for St. Kitts, Nevis and Virgin Islands.

Edgar Tripp, Port of Spain, Trinidad, agent for Trinidad and Tobago.

C. E. Sontum, Christiania, Norway, agent for Sweden and Denmark.

D. M. Rennie, Buenos Ayres, Argentine Republic, agent for Argentine Republic and Uruguay.

In addition to their other duties, the undermentioned will answer inquiries relative to trade matters, and their services are available in furthering the interests of Canadian traders:

J. G. Colmer, 17 Victoria street, London, S.W., England.

Thomas Moffat, 16 Church street, Cape Town, South Africa.

G. H. Mitchell, 15 Water street, Liverpool, England.

H. M. Murray, 40 St. Enoch Square, Glasgow, Scotland.

Harrison Watson, Curator, Imperial Institute, London, England.

# WOOD PULP DEPARTMENT

## PULP AND PAPER PRODUCTION IN THE UNITED STATES.

THE United States Department of Labor recently undertook the collection of data relative to the production of paper and pulp during the six months of 1898, from January 1 to June 30. Out of a total of 723 plants in the United States which were in active operation during this period, statistics were obtained from 644 of these. By the word plant is meant one or more mills in the same locality, owned or operated by the same person, firm or corporation. From 644 plants complete returns of production were secured, while for 79 plants an estimate has been made which is believed to approximate closely the actual facts.

The tables compiled show that during the six months there were produced in the 644 plants from which reports were secured, 994,087 tons of paper and 619,383 tons of pulp, the value of the paper being $48,689,880, and that of the pulp $13,428,542. In this connection it should be noted that the pulp produced was almost entirely consumed in the manufacture of the 994,087 tons of paper, and that therefore its value should be added to that of the paper in order to secure total value of product.

Of the 619,383 tons of pulp produced, 367,744 tons were ground wood pulp, 173,420 tons were sulphite fibre, and 74,379 tons were soda fibre, while 3,840 tons of cotton fibre were produced.

## FIBRE FROM SAWDUST.

HERE is a new and original idea that reaches The Paper Mill from a well-known chemist and government official. He has evidently solved the problem of manufacturing fibre for paper-making from sawdust and shavings. The detailed account of his discovery is given below :

"The special object of my process is to prepare a fibre suitable for paper making from planer shavings, sawdust and the like. Of course I know that this is an old, old problem, upon which effort and money have been expended without developing a commercial process, but I have looked into the matter with care and discussed it with people in a position to know about the difficulties in the way of a successful process, and particularly with a man who had considerable experience some years ago in trying to make fibre from sawdust. As a result of my work I have found that there are three chief difficulties in the way of commercial success : First, the small yield of fibre ; second, the excessive amount of solution required in boiling ; third, the difficulty of washing the fibre, which required the use of large amounts of wash water, resulting in the production of large quantities of solution too weak in soda to pay for the recovery of the soda. If there are other serious difficulties I have not yet come across them, and I would be glad if you would point out any other obstacles in the way of commercial success.

In my process I provide means for overcoming all three of these difficulties. The small yield of fibre by the ordinary soda process is due to its being too drastic when applied to sawdust on account of the state of the subdivision of the wood. Cellulose is chemically very inert and yet under the severe treatment of the ordinary soda, boiling considerable cellulose, is dissolved and wasted. My treatment is comparatively mild in connection with my method of washing the resulting fibre.

Ordinarily wood is entirely submerged in soda solution during boiling. Owing to the light and bulky nature of shavings and sawdust this requires a very large volume of solution, but I have ascertained by trial in the laboratory that this is not necessary and that a much smaller volume of a weaker solution will do the work. Finally I wash the resulting fibre in the boiler by means of steam generated within the boiler, and thus the soda is removed from the fibre and a concentrated solution obtained.

Now, just what I do is as follows : I have found that shavings and sawdust will hold from three to four times their weight of water without showing any visible excess of liquid. Therefore I mix them with about this amount of soda solution and charge the mixture into a closed boiler of special construction. The charge rests on a perforated false bottom. Into the space below the false bottom is put water or weak soda solution, leaving a clear space above the liquid. There is also a clear space above the charge. There is an open passage through the charge by means of a tube communicating between these two open spaces. There is also an ordinary vomiting arrangement to circulate the solution through the charge.

The boiler being charged and closed, the liquid in the bottom is heated to give steam pressure and a solution is circulated for a sufficient length of time. The circulation is then stopped and steam from the liquid in the bottom of the boiler is used to wash the soda solution out of the fibre.

EXTRAORDINARY

We are cleaning up numerous yards in connection with our Mills in the South, to make room for next year's new cut.
Stock consists of all grades and thicknesses Hardwood Lumber, Yellow Pine and Cypress, including a big surplus of No. 1 and No. 2 Common Yellow Pine, Select and Common Cypress. All of the above a year and over dry.
If you are in the market for any kind of Hardwood Lumber, Yellow Pine or Cypress, or expect to be in the future, send us your enquiries. The stock has to be moved, and if we can pick your orders out of any of the lots referred to, we will quote you prices to save additional handling expenses.

Address all Correspondence to our Main Office :

CHICAGO, ILLS., U.S.A.

For this purpose it passes up through the open tube to the top of the boiler, where there is a condensation and the water passes back through the fibre to the bottom of the boiler, removing in its passage the soda and dissolved intercellular matter from the fibre. This can be continued until all the soda is removed, but it would undoubtedly be more econimical to stop the boiling before the complete removal of the soda, and finishing the washing outside of the boiler in the usual way. The weak soda solutions thus produced could be returned to the bottom of the boiler in a subsequent charge. By this method of operating the soda is obtained in a concentrated solution with but slight mechanical losses.

The advantages of this proceeding are these: The wood can be disintegrated with a minimum amount of soda and the soda obtained at the end of the operation in a concentrated solution. The steam treatment not only removes the soda solution from the fibre, but the completion of the process takes place under comparatively mild conditions, favorable to saving cellulose from being dissolved. The boiler can be heated by a direct fire at a considerable saving.

The operation as I have above described it forms a complete process, but I think that it would be cheaper to subject the shavings to a preliminary treatment to remove a large part of the intercellular matter as follows: I mix the shavings and sawdust with three or four times their weight of the soda liquors from the closed boiler and heat the mixture in an open boiler. I have found by actual trial that such a mixture can be heated several hours above the boiling point of water, and yet retain a large part of the water, and that about half of the intercellular matter is thereby rendered soluble. On the large scale I would proceed as follows: I would have a large upright boiler, open at the top and arranged at the bottom somewhat like an iron ore roaster (I am familiar with ore roasting), and provided with steam coils or jackets for heating. I would charge the mixture of shavings and soda liquor into this open boiler, and heat it at the bottom. With a moderate height of boiler I am sure the bottom could be heated to 230° to 240° F. The water that is given off as steam at the bottom is condensed in the cooler part of the charge. When the charge at the bottom is sufficiently cooked it is withdrawn and fresh mixture added at the open top, and these operations are repeated. This process is then carried on as a continuous operation. The product of this process is to be put into a press and a limited amount of water added. On applying pressure nearly all the soda is removed in the form of a concentrated solution, which can be evaporated for the recovery of the soda. Or it may be put into a centrifugal machine and slightly washed. The material is then put into the closed boiler and subjected to the operation.

All the points in the complete process as I have described it, except the circulation of the liquid in the enclosed boiler, have been demonstrated in my laboratory in a small way, and I know that they are operative. I can, if you wish, give a mass of details of these tests, for I keep full records of such work, but perhaps it will be sufficient at present to say that they show that the strength and amount of soda solution required are both low, and that the yield of fibre would be comparatively high.

Of course, planer shavings and sawdust, being waste products, are much cheaper than pulp wood. Nearly all my experimental work has been upon white pine shavings and sawdust. A further advantage is the fact that they are produced in abundance at and near many cities where there are local paper mills which could use the fibre produced to good advantage.

While I have described this process as applied to sawdust and shavings, I think that the principles of the closed boiler cooking could be applied with profit in the ordinary process of boiling wood chips in soda solution. I have tried to set this matter before you clearly and concisely, but if I have not done so I would be glad to make any additions or to answer any questions that I can."

## ITALIAN PULP TRADE.

ACCORDING to the official returns for the first two months of this year (the latest available), the importation of wood pulp into Italy is largely upon the increase, says the Paper Mill. During the period mentioned, 64,714 quintals of "cellulose" (presumably chemical pulps) of a value of 1,941,420 lire, or about $77,659, were imported. For the corresponding period of 1898 the figures were 50,747 quintals, valued at 1,522,410 lire ($64,096), so that the increase during the twelve months is well over 20 per cent. The two months' import of mechanical pulps amounted to 1,372 quintals of moist (50 per cent.) and 11,086 of dry, respectively valued at £823 and £6,651. No moist pulp was imported during January and February, 1898, and only 10,047 quintals of dry, valued at £6,028, so that in this latter branch the annual increase is about 10 per cent.

The South Gardener pulp mill at Gardner, Me., is announced to have shut down owing to scarcity of logs.

## PULP NOTES.

In 1898 Norway supplied Great Britain with 141,455 tons of ground wood pulp, Canada 36,359 tons, Sweden 24,043 tons, United States 13,475 tons, and Holland 2,584 tons.

The imports of wood pulp by Great Britain during the past five years were as follows: 1894, 279,765 tons, £1,432,400; 1895, 297,295 tons, £1,574,302; 1896, 327,080 tons, £1,684,667; 1897, 388,304 tons, £1,930,761; 1898, 404,842 tons, £1,894,394.

Prof. Grover, of Orono, Me., finished last month his hydraulic survey to the Tobique river, in New Brunswick, from its mouth to a point about three miles above the narrows. It is believed that upon his report will depend the carrying out or otherwise of the proposed paper and pulp mill project, in which A.H. Hilyard, of St. John, and others are interested.

The Pensacola Paper Mills have started in successful operation, manufacturing a high grade of manila paper from pitch pine pulp. The material used is waste from saw-mills, heretofore burned in slab piles. The mills have a capacity of five tons a day, and will give employment to fifty men. The pulp is made by a secret chemical process owned by the company, a discovery of R. Thomas, manager of the mills.

The Paper Mill comments as follows regarding a shipment of pulp from Canada:—The recent shipment from Canada to England of the largest cargo of wood pulp that ever crossed the sea, has aroused the enthusiasm of our English contempories. We are pleased to learn from one of these enthuiasts that "the discharging of this immense wood pulp cargo was effected in a comparatively short time, and that the cargo has turned out to be in perfectly sound condition."

## "WANTED AND FOR SALE."

Persons having for sale or wishing to purchase a particular lot of lumber, a mill property, timber limits, second hand machinery, etc., in fact, anything pertaining to lumbering operations, will find a buyer or seller, as the case may be, by placing an advertisement in the "Wanted and For Sale Department" of the CANADA LUMBERMAN Weekly Edition. Testimonials to the value of this department by those who have given it a trial state that the results of advertisements were frequently better than anticipated. The cost is comparatively small. Mill owners might, with profit to themselves, make use of this method of advertising their stock to a still greater extent.

The latest and best improvement in

## BAND SAW MILLS

No off-set used on Carriage.

In double cutting Mill both edges of saw are toothed—the advantages of this:

**Cuts Two Boards** in about same time single cutting mill **Cuts One.**

Teeth on both edges equalizes the strain on saw—avoids cracking—saw lasts longer—requires less work to keep in tension.

Teeth on both edges cut their clearance—no danger throwing saw off wheels.

Saw stands heavier feed—strain on both sides being equalized.

Top of cut being always right at wheel where saw leaves it—saw is exceptionally stiff, making perfectly true lumber in fastest feed.

Only extra tools needed over ordinary band: A double grinding or filing machine—special clamp.

Investigate the only mill running in Canada as a **Double Cutter,** operated by J. D. Shier, Bracebridge, and place your orders early.

### EXTRACTS FROM MR. SHIER'S LETTERS RE TELESCOPIC BAND MILL:

MAY 19, 1899.—"The Band Mill is first-class; the best mill to make lumber in Canada. It is a dandy; I think you have struck a good thing.
MAY 22, 1899.—"The Band is all that could be desired. It is the best lumber rig in Canada to-day."
MAY 31, 1899.—"The Mill is doing well. I am running day and night."
JUNE 2, 1899.—"It was a good thing to have that mill introduced. They will certainly take the run, and no doubt you will build a large number of them"
JUNE 2, 1899.—"The Mill is all right, and every person is delighted with it."
JUNE 9, 1899.—"Mill doing splendidly. Cut steadily increasing. Fully expect it will reach the 50 M mark in average stock before long (per 10½ hours)."
JUNE 12, 1899.—"The Mill is very satisfactory. It is the coming Mill."
JUNE 17, 1899.—"Well, every person who sees this Mill states that it is the most complete mill they ever saw. I predict a bright future for you in building these Mills. All practical millmen fully agree that this is the mill."
JULY 5, 1899.—"The Mill is doing well, cutting good lumber on both shifts."

**Mr. Shier had no assistance outside of his own men in starting and operating the elescopic—never had the slightest trouble with the Band Mill since he started.**

For over 50 years we have been building a reputation for High Class Machinery. Our Mills and Machinery extend, in Canada, from the Pacific to the Atlantic—Newfoundland, Central and South America, New Zealand, Australia, Austria, Roumania and the far east. Our aim is ever to produce the Best, not the Cheapest, with the invariable result that where we receive one order others follow quickly. Our new works, occupied in 1895, gave us the much needed room for expansion, coupled with the most modern facilities for economic production and prompt shipments. This year we have found it necessary to increase our buildings and add very materially to our already large equipment of tools and employees.

# Manitoba and the Territories

## THE LUMBER INDUSTRY.

ALTHOUGH essentially an agricultural country, the province of Manitoba possesses a considerable extent of timber lands. Of a total area of 64,-6 square miles, 25,626 square miles are said to nsist of wooded land. A portion of this, how-er, is but sparsely timbered. The Northwest erritories, comprising the districts of Keewatin, ssiniboia, Saskatchewan, Alberta and Atha-sca, have an area of 2,371,481 square miles, or mewhat greater in extent than all the other ovinces of the Dominion. Of this area 696,952 uare miles are designated as forest land. he timber in Manitoba and the Territories is iefly spruce and white pine, the latter being und in greatest abundance in the Lake of the Woods district.

There are under license in these provinces ap-roximately 2,700 square miles of timber limits, vided in the different agencies as follows: Winnipeg agency, 1,198 square miles; Calgary gency, 1,048 square miles; Prince Albert gency, 342 square miles; Edmonton agency, 17 square miles. In addition, there are over 00 square miles under license in the Yukon ter-tory. Among the large holders are D. E. Sprague, of Winnipeg; Hanbury Manufactur-ng Co., of Brandon; Peter McArthur, of Fair-ord River; H. T. Mitchell, of Selkirk; Mackenzie & Mann, of Shoal River, and Peter McLaren, the atter controlling limits on Old Man river. The principal limits are on tributaries adjacent to the Assiniboine and Red rivers.

Licenses to cut timber are acquired at public competition by tender. A rental of $5 per square mile is charged for all timber berths, and in addition the following dues are to be paid: Sawn lumber, 50 cents per M. feet; railway ties, 1½ cents each for six feet and 1¾ cents for eight feet in length; shingle bolts, 25 cents per cord; all other products, 5 per cent. on selling price. Permits to cut timber are also granted by public competition, except in the case of settlers who require the timber for their own use. The dues payable under permits are $2.50 per thousand feet for square timber and saw logs of pine, cedar, spruce and tamarac, $3 for saw logs of oak, elm, ash or maple, and $2 for poplar saw logs; railway ties 8 feet long, 3 cents each; telegraph poles 22 feet long, 5 cents each; shingles 20 cents per thousand.

A large percentage of the lumber used in Manitoba and the Territories is obtained from the Lake of the Woods district, being supplied by the Rat Portage Lumber Co. and the Kee-watin Lumber Co., both of which own extensive mills and large areas of standing pine timber in Northwestern Ontario. Other large mills in Ontario supplying the western market are those of Vigars & Co. at Port Arthur, Graham, Horne & Co. at Fort William, and Savanne Lumber Co. at Savanne. The only mill of importance situated in the city of Winnipeg is that of D. E. Sprague.

The lumber requirement of Manitoba and the Territories is steadily increasing, and as settlers are now rapidly coming in from all parts of the world, it is only a question of a short time until the demand for lumber in these provinces will exceed that of any other province in the Dominion. The superior quality of wheat and other cereals grown upon the land, and the greater yield per acre, are now universally acknowledged. A yield of some 30,000,000 bushels of wheat and as much more of other grains from an area of 1,500,000 acres in itself speaks volumes for the future of Western Canada. There are within the provinces probably between 250 and 300 retail dealers in lumber, about 200 of whom are members of the Western Retail Lumbermen's Association.

Below will be found illustrations and descriptions of some of the saw milling establishments within these provinces.

VIGARS & CO.—MILL AND LUMBER PILES AT PORT ARTHUR, ONT.

VIGARS & CO.—SAW MILL AT PORT ARTHUR, ONT.

## VIGARS & COMPANY.

This firm was established in 1876, and own the only saw, sash and planing mills in operation on the shores of Thunder Bay. The capacity of the mill is 90,000 feet per day, and attached thereto are the requisite sash and planing mills.

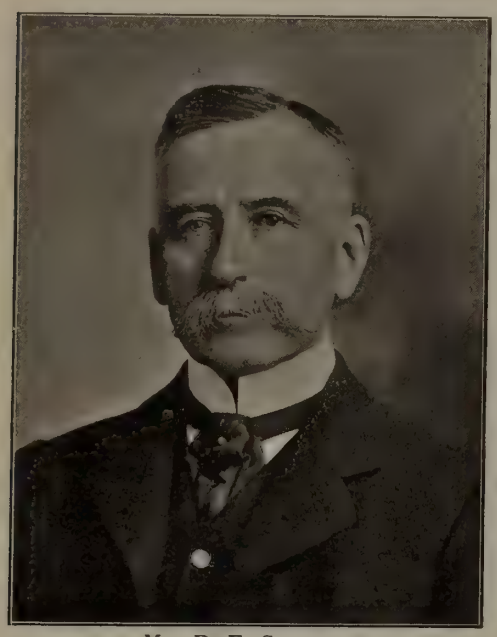
The firm are the owners and lessees of large and valuable timber limits, and have special facilities for carrying on the lumber business, as they are able to bring in logs either by water or rail, with every opportunity of booming the same. They also have large and extensive piling grounds adjoining the mill, with the tracks of the Canadian Pacific, Port Arthur, Duluth and Western, and Ontario and Rainy River railways entering their yards. They are thus enabled to ship lum-

ber east or west with the greatest dispatch. Also adjoining the mills are the docks of the Port Arthur, Duluth and Western and Ontario and Rainy River railways and the Dominion Coal Co.

The firm make it a point to keep ahead with the most improved machinery in all branches of the business, its motto being "up to date." They are also large dealers in sashes and doors.

## D. E. SPRAGUE.

Mr. D. E. Sprague went to Winnipeg with W. J. Macauley in 1872 from Waubaushene, Ontario, where he had been for some time connected with the Georgian Bay Lumber Co. In



Mr. D. E. Sprague.

1882 he established his present lumber business on Higgins ave., Point Douglas, and since that time it has been steadily growing until it has assumed its present proportions.

The mill consists of a single circular saw, edger, trimmers, slab-table, lath and shingle mills, and all other accessories of a first class plant. It has a capacity of 50,000 feet in ten hours, and the cut for the present season, running night and day, will be about 11,000,000 feet. Over 100 men are employed the year round in manufacturing the lumber and cutting logs on the timber limits.

A well equipped planing mill, containing two matchers, two surfacers, one moulding machine, three self-feed rip saws, two swing cut of saws, one resaw, and one large circular re-saw, together with the necessary blowers, shaving vault, etc., is operated in connection with the saw mill. Mr. Sprague has also recently added to his establishment one of the latest and most approved dry kilns, with a capacity of 48,000 feet. This is the only up-to-date dry kiln between Port Arthur and the coast, and has proved a great advantage to the city, enabling builders to procure thoroughly seasoned material for finishing purposes, which otherwise it would be almost impossible to do.

The most perfect system prevails in every department, and visitors will find much to admire in the bright and spacious office, the well kept stable and the 40 odd horses, in whose fine appearance Mr. Sprague takes a personal pride.

A good understanding of the magnitude of the establishment may be obtained from the accompanying illustrations.

D. E. Sprague—Saw Mill at Winnipeg.

D. E. Sprague—General View of Mills and Yards.

## HUGHES & LONG.

The above firm are also located at Brandon, Man. About three years ago they purchased the saw mill and plant of J. H. Hughes & Co., and claim to be about the only firm in the west that handles lumber from the stump to the customer, every branch of their manufacturing being within themselves. They own considerable standing pine on the Big Fork river in Minnesota, which they run down the river to their mill on Rainy river, where their logs are sorted from those of other companies. They have their own steam tug and barges, and ship their lumber to Rat Portage, where it is loaded on cars and distributed to their many customers throughout Manitoba and the Territories. They have yards at Brandon, Man., and Beaver Mills, Ont., and through the yard at the former place handle large quantities of American lumber.

Mr. Long is a man of considerable experience and

means, having for some time been engaged in the lumber business in Minnesota. Their cut this year was in the neighborhood of five million feet.

## THE HANBURY MANUFACTURING COMPANY.

Mr. J. Hanbury, whose portrait appears on this page, is the head of the firm known as The Hanbury Manufacturing Company, and unquestionably stands in the front rank of Brandon's enterprising and successful business men. Although perhaps he has done no more for himself or for those about him, than others have done or could have done under similar circumstances, yet he at no time has been slow to turn his opportunities to the best possible advantage. The secret of his success cannot be attributed to luck or superabundance of golden opportunities, he having perhaps encountered but his fair share of these, but rather to his capacity of recognizing such opportunities; to his fearlessness in attempting promising enterprises and in pushing them to their fullest extent; to his keen business management and excellent executive ability; and lastly, though by no means least important, his business sympathy or capacity to appreciate that others

D. E. Sprague—Interior View of Office.

are at the same time struggling alongside of himself for a place.

Removing, in 1882, from Ontario to Brandon, when it was but a village on the prairie, for the most part unbroken, he started in an unpretentious way as a contractor and builder, which business he followed exclusively until 1889. During seven years he succeeded in not only accumulating a reasonable share of wealth, but also, and what is better, established for himself a reputation for honesty and reliability, which formed the first round in that ladder of success which he is still rapidly climbing.

During the summer of 1889 Mr. Hanbury purchased a planing mill which had been abandoned as unprofitable, and which, after extensive repairs and improvements, he operated in connection with his contracting. He thus found himself in a better position for business than ever before, and during the following interval up to 1894 he erected many of the town's finest buildings, including the large post office, general hospital and Merchants' bank.

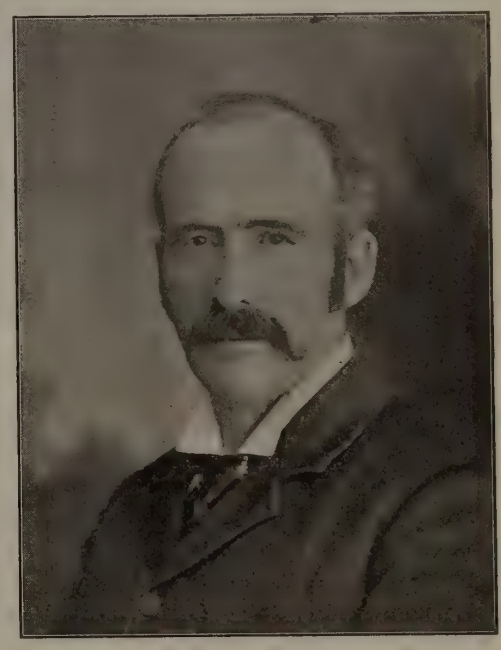
Through all these years he never shrank from heated activity, but proved himself an accurate calculator, an efficient and inspiring manager, and an ardent worker. Seldom was he avoidably absent from the scene of active operations, but at all times was ready to lend an active hand himself, whenever occasion required it. During this last mentioned year, when the retailing of lumber became a leading factor with him the contracting business was allowed to lapse considerably, although not altogether, owing mainly to the impossibility of personal supervision. But even in this present year he erected five of the finest residences in the town.

With more concentrated attention to the development of his lumber business, the hoped for result was attained, for not only did the Hanbury yards become the leading retail market, but they at the same time rapidly grew to be the source of extensive wholesale shipments to an ever increasing area, until now Mr. Hanbury might be called the "lumber king of Manitoba."

Until the spring of the present year the rough pine product, imported from Minnesota, was handled almost to the exclusion of other varieties, though the British Columbia cedar and fir composed a large share of the finishing material, as indeed they continue to do. Other material in the line of lime, paper, brick, etc., have all along been extensively carried, and for the first time this year a full line of builders' hardware was put in stock. With this last addition it is possible to obtain from this firm anything and everything which ordinarily may be said to be requisite for the construction of a building.

Building material, with one exception, is all that claims his attention at his headquarters at Brandon, and of that exception, namely coal, he is the heaviest local dealer. The handling of this fits in well during the winter months, when the lumber trade is necessarily more or less slack, and helps to keep the teams occupied, thus never allowing the activity about the premises to materially diminish. The Canadian Anthracite coal mined in Alberta is mainly handled, and of this the large sheds have been full since the middle of August, ready for the coming of the cold weather.

As has been mentioned, American pine has



Mr. J. Hanbury.

all along been the staple commodity of the firm, but with the opening up of this season Mr. Hanbury, with his wonted ability to see and grasp a good thing, succeeded in taking over the entire business of the Assiniboine Lumber Co., of Brandon, including yards, containing three million feet of manufactured spruce and tamarac, lumber sheds, saw mill, winter's cut of logs, seventy-five thousand feet in lumber, timber limits, with all utensils and appliances for operating same, and a large branch yard and hardware store in the town of Hamiota. This last mentioned makes the second of his branch establishments, the other being in Virden, and having been purchased some time since. This extension, added to his already well developed trade, at once placed Mr. Hanbury in the rank of Canada's prominent lumbermen. While it naturally means that the American article from now on will be a side line, yet, from the following rough summary, it can easily be seen that there is abundance of scope for enterprise and expansion in connection with the home grown material.

The saw mill has a capacity of from thirty to forty thousand feet of lumber per day of ten hours, and this year never was idle day or night from the beginning of operations in June until the 25th of August, when the last log was converted into lumber. The conducting of this—the planing mill, yard, warehouse and teaming—involves the employment of over one hundred and fifty men, with an aggregate monthly wage of from $4,500 to $5,000. The shipping capacity, outside of local freight, in the way of sash, doors, etc., during the present summer has been from six to ten cars per day, having for their destination points east as far as Portage la Prairie, west to Medicine Hat and south to the border, cover-

THE HANBURY MANUFACTURING COMPANY, BRANDON, MAN.—GENERAL VIEW OF MILLS.

ing, roughly speaking, the whole of eastern Assiniboia and western and middle Manitoba. The limits, covering an approximate area of two hundred square miles of nearly solid timber, and about the only extensive ones in Manitoba, are situated some two hundred miles north-west of Brandon—that is, across country, or, to follow the winding course of the Assiniboine river, which floats the logs down, over seven hundred miles.

This is merely a rough estimate of the present situation, and is important mainly as being indicative of what this industry is now, and what it is likely to become, for Brandon. Just to take a look into the immediate future, it might be mentioned that since increased trade has outgrown the capacity of the present planing mill—which itself gives employment to a gang of between thirty and forty men the year round—the foundation has been prepared for the erection of a large factory to adjoin and be connected by a truck system with the already completed three-storey warehouse, which measures 50 × 100 feet, and which contains the spacious offices. This, along with other contemplated improvements in connection with the sheds and saw mill, will make this the largest and most complete plant for the manufacture and handling of lumber in the west. To the further establishment of this claim for certain expansion, it might be mentioned that all arrangements have been completed for the sending of three hundred men to the bush this coming winter, who will be expected to get out logs for from eight to ten million feet of lumber.

In view of this enormous increase in his business, it is not to be expected that Mr. Hanbury could continue personally in more than the general management of it, leaving the detail and practical management to competent assistants. His faculty of seeking out good men and of retaining them has no doubt been no small contributing element to his success. On account of this and other influences, he has of late taken a more active interest in public and civic affairs; although at no time since his arrival in the west can it be said that he has been unconcerned regarding such matters. At the present time he is a city alderman and chairman of the finance committee. In fact, he is ever ready and willing to do whatever he can for the furthering of the city's interests, and from any point of view Brandon finds in him one of her most able and deserving sons—men like whom may she be ever acquiring an increasing number.

RAT PORTAGE LUMBER COMPANY—MILL NO. 1.

## THE RAT PORTAGE LUMBER COMPANY.

Rat Portage, Ontario, is the headquarters of one of the largest lumbering concerns in the Dominion of Canada, known as the Rat Portage Lnmber Company, Limited. For some time previous to the year 1892 there were in existence at Rat Portage and Norman five lumber companies, viz., The Western Lumber Company, The Minnesota and Ontario Lumber Company,

MR. D. C. CAMERON, President.

The Safety Bay Lumber Company, Cameron & Kennedy, and Ross, Hall & Brown. In that year these companies decided to amalgamate, under the name of the Ontario & Western Lumber Company, Limited. The name of this firm was, a few years later, changed to the Rat Portage Lumber Company, under which style the business is now conducted.

The Rat Portage Lumber Company thus operate five mills, with a combined capacity of 100,000,000 feet annually. Since obtaining control of these mills, the company have been steadily increasing and improving the plant, until today it stands second to none in the Dominion.

In connection with the mills there are large planing mills and a sash, door and box factory, the output of which is very large. Last year improved machinery was installed, including an electric lighting system and electric tramways for delivering the lumber from the saws

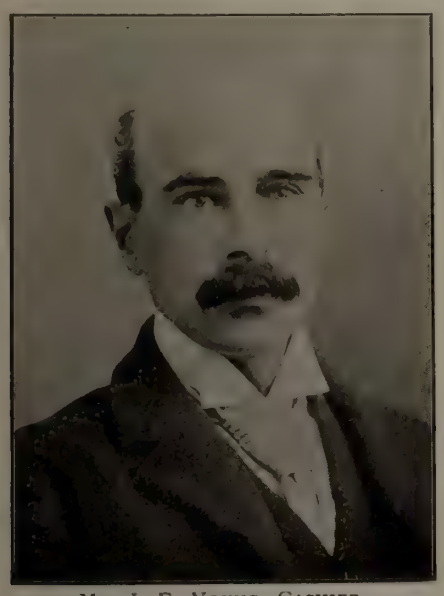
through the yards, a great improvement over the horse-and-cart service previously employed.

Almost the entire output of the Rat Portage Lumber Company's mills is marketed in Western Canada, and each year has shown a steady increase in the business of the company. They have branches at Winnipeg and Brandon, Man., where a complete stock of lumber, sash and doors and other building mater als is always carried in stock. Besides manufacturing lumber,

Mr. Wm. Robertson, Secretary.

shingles, lath and sash and doors, the company deal extensively in railway ties, telegraph poles, cedar posts and piling. They own extensive limits in the Rainy River district and also purchase logs from jobbers in Northern Minnesota, which are towed through the Lake of the Woods to their mills.

The company employ some 700 men during the summer season, while in winter the number reaches nearly 1000, the most of whom are in the lumber woods getting out logs for the ensuing



Mr. J. E. Young, Cashier.

season. The pay roll of this concern averages about $25,000 per month, a fact which demonstrates the great benefit of the business to the town of Rat Portage. D. C. Cameron is president and general manager of the company, Wm. Robertson secretary, and J. E. Young cashier, portraits of whom are presented. Views of No. 1 and No. 4 mills are also shown herewith.

---

Mr. W. R. Thompson, sawmill owner of Teeswater, Ont., has lately returned from a business trip to Great Britain.

Rat Portage Lumber Company—Planing Mill and Sash and Door Factory.

## PERSONAL.

Mr. F. X. Blanchere, a Government timber inspector in the Yukon, has resigned, and has been succeeded by Mr. Chas. Sylvester, of Athabasca County.

Mr. A. McDonald, for seven years book-keeper and accountant for the Georgian Bay Lumber Co. at Waubaushene, Ont., has accepted a similar position with Williams Bros., of Glen Huron.

Mr. William Bowden, of the Hull Lumber Co., gave The Lumberman a call on his return from the meeting of the Knights Templar at Windsor, at which he had the honour of being elected High Constable.

Messrs. F. N. Waldie and R. T. Waldie, sons of Mr. John Waldie, of the Victoria Harbor Lumber Co., Toronto, sailed for England last month on the White Star steamer "Teutonic." It is their intention to spend the winter in Eygpt.

Mr. J. D. Sinclair, who operates a saw mill at McIntyre, Grey County, gave the Canada Lumberman a call while in Toronto attending the Industrial Exhibition. Mr. Sinclair cuts hardwoods exclusively, including broom handle stock.

Mr. E. Stewart, who has recently been appointed chief inspector of timber and forestry for the Dominion, has just made an official trip through Manitoba and British Columbia, with a view to acquainting himself with the condition of the forests of Western Canada.

Mr. A. B. Gordon, of Pembroke, for many years with tne lumber firm of Hale & Booth, has replaced his father in the firm of Booth & Gordon, and has removed to Rayside, where he will reside in future and have charge of the saw mill there.

Rat Portage Lumber Company—Yard at Mill No. 1.

The Review of Reviews for October accords to "Dewey Day" its appropriate recognition, publishing an illustrated description of the artistic decoration in New York from the pen of Ernest Knaufft, the well-known writer on art subjects.

Rat Portage Lumber Company—Mill No. 4.

# THE WESTERN RETAIL LUMBERMEN'S ASSOCIATION.

PARTICULARS OF THE ORGANIZATION — OPINIONS OF MEMBERS AS TO ITS USEFULNESS—PORTRAITS OF OFFICERS.

ON the opposite page are presented portraits of most of the present officers of the Western Retail Lumbermen's Association, an association that is unique inasmuch as it is the only organization of retail lumbermen in Canada. Notwithstanding the many difficulties encountered in the working of such an organization, the history of this association, formed about ten years ago, has been one of continued success. It has exercised a beneficial influence upon the lumber trade of Manitoba and the Territories, and has resulted in much good by protecting the trade and affording an opportunity to members to become acquainted with each other.

The affairs of the Association are managed by a board of directors, which consists of six members of the Association, in addition to the president, vice president and secretary. The objects of the Association include the prevention of more than a reasonable number of yards at a single point, and as far as possible the prevention of price cutting. By following legitimate business methods, the standing of every man in the trade has been strengthened, with the result that scarcely a failure has occurred among active members of the Association. In turn, this has proven beneficial to the wholesale dealers, who are honorary members of the Association. It is contended that in no instance has the price of lumber been advanced as a result of the Association, but on the contrary, from the safe character of their business, wholesalers have been enabled to reduce their prices.

The membership of the Association has steadily increased, the number of new members taken in during the past year being greater than in any previous year, until now the membership includes nearly all the dealers and manufacturers in the territory covered. A permanent secretary has been appointed in the person of Mr. J. Cockburn, of Winnipeg, who is familiar with every detail of the Association. An understanding of the principles on which the Association is conducted may be obtained from the following clauses taken from the by-laws :

"Price lists shall be fixed and established subject to the revision and approval of the Secretary-Treasurer or Directors, whose decision shall be binding, for each point or group of points where retail yards are operated, and each active member shall sign the list fixed for the point where he is operating a yard, and such signature shall bind such member to carry out and adhere to such price list, subject to the penalties provided by the By-laws. Not less than twenty per cent. shall be added to the wholesale cost as a retail price on all lumber, timber, and other material ordinarily sold in a retail lumber yard, but not listed on the price list. In the cases of points intermediate where no price list has been established, the price to govern shall be the same as that of the adjacent point having the lowest price list.

An active member may ship in car load lots or less quantity, lumber, timber or other material to points outside the territory for which such member has signed a price list ; but no such lumber, timber or other material shall be sold at less than the price fixed by the price list arranged for the territory into which such shipment is made. In no case shall such lumber, timber or other material be sent on consignment for sale, or to be stored for sale.

Except as provided in the next section, no member of the association may be a contractor for doing work, or become the security for the due completion of work contracted for, and no lump sum shall be submitted or offered to a contractor or consumer for the supply or furnishing of lumber, timber or other material. In all cases detailed prices must be given as provided in the price list and strictly adhered to, and the provision as to adding twenty per cent. to wholesale cost carried out. The secretary-treasurer, executive committee, or board of directors may instead of expelling or suspending a member for violation of this clause fine the offending member in a sum not exceeding ten per cent. of the money value of the contract. In case such fine is not paid in two weeks after personal notification, such offender shall be expelled.

The executive committee or board of directors at such points where there is only one active member established, may allow such member to enter into contracts, provided that no interference with the business relations of other members is likely to arise therefrom.

Honorary members shall not sell lumber, timber or other material usually sold in retail lumber yards to any firm or corporation other than to an active member of this association, except as hereinafter provided.

Honorary members may, however, sell lumber, timber or other material to contractors or consumers for building elevators, flouring mills, or to railway companies for their own use, and the corporation of the city of Winnipeg, and to contractors for Winnipeg civic purposes, and only when the quantity required amounts to one hundred thousand feet or upwards, and they may sell building paper to merchants.

Honorary members operating mills in a city, town or village, may sell to contractors or consumers at the locality where the mill is situated at the retail prices fixed for such locality, but such honorary members shall be liable to the restrictions and penalties provided by the by-laws and affecting active members in regard to such sales.

No member shall purchase from or sell to any member who has been expelled from the association any lumber, timber or other material usually sold in retail lumber yards. No member shall so purchase from or sell to any member while such member is under suspension.

Active members shall make their purchases of lumber, timber and other material from honorary members only."

The CANADA LUMBERMAN solicited the opinions of some of the members of the Association as to the benefits derived from membership in the organization. The replies received are given below :

## FROM ACTIVE MEMBERS.

T. D. ROBINSON, Winnipeg, Man. : "From a retail standpoint in this city the association cuts no figure, for we are all doing our business in our own way without regard to it, and from a wholesale standpoint the rules are only observed when it suits them best. An association in any line of business would be a good thing if made by fair men on fair lines, and lived up to, but my experience with them leads me to the conclusion that as they are now constituted the meanest men have the greatest advantage, and consequently are not desirable."

T. H. PATRICK, Souris, Man. : "I think an association is a good thing for both wholesale and retail dealers, if lived up to. If there are crooked members it gives them a splendid chance for their crooked work. The trouble is, you cannot make a crooked fellow straight with an association. On the whole, in my opinion, the association is an advantage."

JOSEPH RINN, Elm Creek, Man. : "I am very favourable to an association of this kind. I think it justifies the retailer to keep in hand a better assortment of stock for his customers then when the trade is cut up. In some cases I find the rules not strictly adhered to, either by honorary or retail members. It would add greatly to the welfare of the association if the members would hold more closely to the rules governing the association."

W. A. SMITH, Carnduff, N.W.T.: "We find the association a great benefit to us in the small towns in this country, as it shuts out unfair competition and will not let more than one dealer locate in points where the business will not warrant two or more dealers. If the honorary members and the active members keep faith with one another it will work in Ontario. The only drawback is that the honorary members are a little too anxious to do business, and in some cases sell to others in order to do business."

CRAWFORD & Co., Pipestone, Man.: "Our association has worked well. The principal benefit in this country is that it regulates the number of yards in the different towns, and thereby does away with ruinous competition, while at the same time it enables the dealer to keep a much better stock and supply his customers far better than he otherwise could do, and at a fair price. It also enables him to pay 100 cents on the dollar always. We certainly think the advantages are quite sufficient to induce the retailers to hold together and keep the organization alive."

R. J. NOBLE, Oxbow, N. W. T.: I have belonged to the association ever since it was organized, and as for any special benefit, I do not know of one bit of good it is at all. I do believe it is of benefit to wholesalers, but not the least to retailers, other than this, I understand that by being organized the number of dealers that can open up in a place is controlled. Other than this I do not know of any benefits. I have never received any benefits from it that I know of. I look at it in this way, if men are not honest, being organized will not make them so, and if they are honest then there is no necessity of being organized."

MACCAUL & HARVEY, Qu'Appelle Station, N. W. T.: "We do not think the average price to the consumer is increased in 5 per cent. of the towns covered, and the mill men sell as much lumber as they would under the old plan, but with this exception, now their accounts are all good, whereas when a small business was divided up between two or three men, some one or two of the accounts in each place was very apt to be bad. Another feature in favor of it is that the stocks carried are better as regards assortment. This, of course, applies to small points only, where, if the trade was divided, neither yard could afford to carry a full stock. We do not think the retailers, that is, the great majority of them, get more than a fair living profit."

J. L. CAMPBELL, Melita, Man.: I believe an association such as we have in the Western Retail Lumbermen's Association is of enormous benefit to the trade, in that it holds the business steady and uniform, preventing the ruinous system of cutting and preventing the establishment of more yards at a point than the trade of the community demands. The advantage accrues to the retailer, not by advancing the margin of profit, but by securing to him more trade at a fair profit. The retailers bind themselves to buy only from honorary members, so far as the latter can supply them, and the wholesalers refuse to sell to the consumers. From the improved condition of the retailer, he is better enabled to pay his obligations to the wholesaler, who by reason of this improved condition of his customers, has his losses reduced to a minimum, which enables him to reduce the margin of profit, resulting in cheaper lumber to the consumer. So that you see the benefits accrue to the retailer, the wholesaler and the consumer without injustice to anyone. The association here is very powerful. It is practically impossible for a retailer to carry on business outside of it ; nor can a wholesaler conduct a satisfactory business unless identified with it. Several attempts have been made to break it both by the American lumber dealers and others, but without avail. The association here is unique in this respect—practically every man within the territory belongs to it. It is said to be the strongest association of its kind in America."

F. CHAPIN, Hartney, Man.: "Our Western Retail Lumbermen's Association is beneficial in quite a few ways ; it is fairly a success, but could be improved. The manner of fixing prices for retailers (I think) should be made by the secretary, according to the difference in freight rates, instead of being left to those who form themselves into a compact, or join together and hold a meeting to fix prices, for the reason that some retailers wish to work for glory and want prices too low. Furthermore, prices must be set with some regard to dealers in towns adjoining. The secretary understands all these interests and is in a position to set the prices ; the wholesalers set their prices and stay with them. The trouble all comes from the retailers, who do not always keep to prices set ; and some refuse to set prices because they think their opponent would not hold to them after they were set. Therefore, the secretary should set prices, and if retailers fell in line, so much the better ; but if they would not, then exclude them. The penalty should be inflicted more rigorously than it has been in the past. The association prevents too many going into the busi-

Mr. G. N. Miller, Virden.

Mr. A. J. Hughes, Souris.

Mr. H. Byrnes, Winnipeg, President.

Mr. R. H. O'Hara, Brandon, Vice-President.

Mr. Isaac Cockburn, Winnipeg, Secretary-Treasurer.

Mr. A. M. Stewart, Morden.

Mr. T. A. Cuddy.

OFFICERS OF THE WESTERN RETAIL LUMBERMEN'S ASSOCIATION.

ness in one place, which has been quite a help and protection to those in the business."

THOMAS LEESE, Birtle, Man. : "The retail lumber associations are of benefit to the members when run with the chief object of their origin in view, viz., the regulation of price and competition. The protection given to the members of such an association should be such that all lumberman should wish to belong to same, not exactly by reason of compulsion, but from seeing the benefits accruing to members, on strictly business lines, such as the prevention of failures by regulating the number of yards and prices at any particular point ; also, the members of such associations should have something to say to the wholesale honorary members as to the price their lumber should be sold for, if intended for the protection of both wholesaler and retailer, as I understand such an association to be. The regulation of both wholesale and retail prices should be part of its business. I do not mean by this that any control should be taken from either party which both should by right exercise, but the retailer must be shown that he is not merely the tool of the wholesaler, but that the interests of both are identical and feel that the association is a "beaut" as it were for the benefit of all its members, in order that everything may work amicably and attain the end for which, I take it, such an association is intended."

J. J. MOON, Russell, Man. : "I have been a member of the Western Retail Lumberman's Association since its inception some six or seven years ago, and consider and always have considered, that it and kindred associations are greatly to be commended. At the cost of a small annual subscription, we have an organization that in regulating the number of operating yards, protects its members from over-competition, and the disastrous tactics that that implies, bringing loss and often ruin to the contending dealers, loss also to the wholesaler, and a consequent shaking of confidence, which tends to injure the trade generally. While not dictating prices, our association regulates prices, in that it prohibits members from selling below a fair, remunerative margin, and it binds the wholesalers to sell only to members of the association, thereby preventing the selling direct to contractors and consumers. But for this latter provision, farmers could club together and get their lumber by the car from the mills. Contractors could get their supplies direct, and the dealer be left to carry on a sort of public accommodation yard to supply the aforesaid parties with what they may have possibly forgotten to order in their cars, and fill other magnificent orders. Our association works harmoniously amongst its members and with the wholesalers, is, I believe, gaining in strength, as it grows in years, and has every prospect of a long and useful life."

H. J. BADHAM, Stockton, Man.: "I am very pleased to write you a few lines regarding my views as to Lumbermen's Association, and I will speak more particularly about the 'Western Retail.' When this association first started I was opposed to it, and it was only when a better head than myself applied for my point, and was actually in possession, that I began to consider the matter. At the present time I consider the association very beneficial for the following reasons: It protects the retail dealer from competition from the parties from whom he buys, the manufacturer and wholesaler. Before the association was formed, a wealthy man could do just about as well with the manufacturer as the local dealer and that I consider unfair competition, for if the rich man can buy his stuff direct, it leaves the local dealer doing business with only the poorer though most probably equally honest men of his locality. It therefore comes to this that the big end of the trade being cut off a much smaller business remains. Every business man knows that given a good volume of business, it can be done much more cheaply than when you have a very small turnover. Another good point about any association is this, that it gives the members of it a chance at certain periods of the year, to meet and exchange opinions and get to know one another, and my own experience has been that many very pleasant friendships are formed in this way. In conclusion I may say that I consider any association fairly conducted a real good thing both from a business and social point of view.

### FROM HONORARY MEMBERS.

E. H. HEAPS & Co., Vancouver, B. C. : "As to the benefits derived from membership in the Western Retail Lumbermen's Association, we would say that we are honorary members of the association. No doubt from a retailers' point of view the association is a useful one ; but from our point of view as wholesalers its usefulness could be largely extended, if the rules were altered so as to make one of the conditions of membership a guarantee as to the stability and commercial standing of its members. Were such a rule established and faithfully enforced by the officials, then the association would be of considerable value to us at this end of the Dominion."

PACIFIC COAST LUMRER CO., New Westminster, B. C., "Affecting us as wholesalers, the benefit derived from membership in the Western Retail Lumbermen's Association is principally that the existence of the association tends to give strength to our accounts, inasmuch as it prevents undue competition in the retail field and makes it possible that fair profits may be realized by the retailer on his sales. Further, as a list of the members is furnished us from time to time, we are enabled to keep ourselves informed as to who are legitimate retail lumber dealers and by being so informed we can avoid doing business with consumers who may possibly be customers of our regular patrons. Wholesalers are expected to sell only to members of the association and retailers are expected to buy only from honorary members. We claim to have adhered rigidly to this rule ; we are aware, however, that many of the retailers buy considerable of their stock from parties outside of the association and if this is persisted in there is danger that the wholesalers will be forced to sell where and to whom they can. As to the working of the association at the other end, we cannot say much from our own experience, but as onlookers we are convinced that it has served a useful purpose for many years, and if its members but chose to regard its rules there is no reason we know of why its usefulness cannot indefinitely continue."

## HOW IT IS DONE.

This is another version of the problem, in that it tells "how it is done," properly and within the bounds of good business principles. It tells of a series of transactions in lumber peculiar to thepresent era of trade expansion: An eastern buyer went over into Canada and succeeded in contracting for the product of 6,000,000 feet of logs. On his return he stopped over in Buffalo and a dealer there offered him $6,000 for his contract, and the trade was promptly consummated. The seller subsequently purchased one and one-half million feet of this same lumber from his Buffalo friend at a price which gave the latter a profit of $1 per thousand, and immediately turned it over to a buyer in another market, securing, in turn, for his own exchequer a profit of $1.50 per thousand. And, to cap the climax, a well-known Buffalonian, who had not figured in any of these transactions—much to his sorrow—makes the solemn announcement that he would gladly have paid $12,000 for a transfer of the original contract with the Canadian mill. A large portion of the profits represented above was made before a saw had entered the logs.—Lumberman's Review.

## TRADE NOTES.

Messrs. Wm. Kennedy & Son, of Owen Sound, Ont., have built a large extension to their factory, to be used for the manufacture of steel castings.

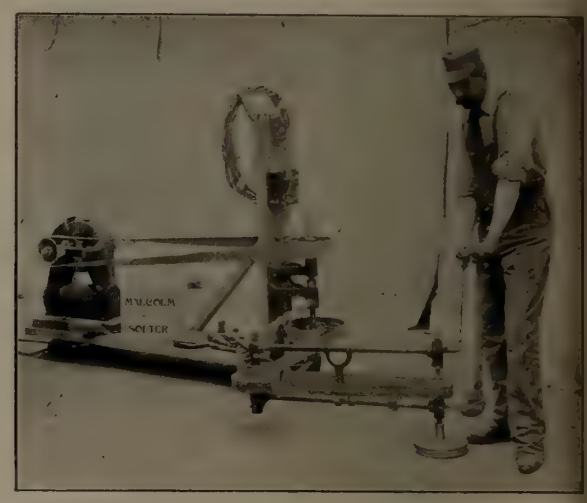
The attention of our readers, the majority of whom are doubtless interested in the subject of improved methods of drying lumber, is directed to the announcement of Messrs. G. W. Reed & Co., of Montreal, appearing in this number, referring to their modern appliances for this purpose.

The well known saw manufacturing firm of Shurly & Dietrich, Galt, Ont., have just purchased the Beaver Saw Works at Sherbrooke, Que. It is the intention of the firm to carry on business there to supply the demand in eastern Canada, and it is understood that the manufacture of axes will also be undertaken. Shurly & Dietrich have just removed their iron bedstead factory from St. Catharines to Galt, where a large new stone building will be occupied.

From Messrs. Boynton & Company, of Chicago, Ill., we have received a copy of a catalogue just issued of their well known embossed and turned mouldings, spindles, wood grilles and automatic turnings of all kinds and sizes. The catalogue is also a very complete price list. Interested persons should write for a copy.

## MACHINE FOR POLISHING PARQUETRY FLOORING.

Herewith is illustrated a machine for polishing parquetry flooring, designed by Messrs. Malcolm & Souter, of Hamilton, Ont., and which was used to good advantage on about 20,000 feet of parquetry flooring laid in the new Royal Hotel in that city. Being unable to obtain men to plane and scrape such a large quantity of flooring, Messrs. Malcolm & Souter overcame the difficulty by inventing this machine. They found that the work was done better than by hand, as no plane or scraper marks were left. The machine is a regular disc sander erected on a platform and driven by an electric motor. The platform is on four wheels covered with rubber ; the two under the motor are on a centre with handle attached for moving about, and the two under the machine are parallel with the platform and keep the machine steady. The motor is two horse power. The only objection met with was the dust, and this was overcome by hanging cotton sheets on all the openings. This machine can only be used profitably on large contracts, but should they have occasion to use it again, the inventors state that they would attach a small fan on one end of the motor and connect it with the disc, and blow all the dust out with a flexible exhaust pipe of canvas. The machine polished about 36 square feet per hour.

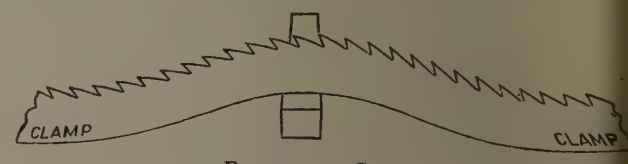


MACHINE FOR POLISHING PARQUETRY FLOORING.

## WHY BAND RE-SAWS BREAK AT BRAZE.

A WRITER in the Wood-Worker asks the cause of band re-saws breaking at the braze, also why they are usually soft at the braze. Mr. A. J. Burton gives the following answer :

If I mistake not, his saws crack ⅞ inch to 1 inch from the joint. The reason is, he uses too heavy and too hot irons for the guage of his saws. The irons are probably rough, too, and the rough places leave impressions in the steel if too much pressure is used. For re-saws four to six inches wide, 18 to 22 gage, use irons ½ x 1½ inch, smoothly dressed. If there are scratches in the irons they will show in the braze. Remove the irons soon as they change from a red heat to a sky blue. Do not pour water on braze ; it will make it soft at that heat. Using a shingle for a fan, fan the braze from the moment you take off the irons until cool, then file off surplus solder and roll (not hammer) the braze until you get some tension in it, and it will be nearer flat than if you use the doghead. With the cross-face hammer, striking light blows, proceed to level up the joint, making it flat as possible. After getting it as flat as possible, bend the saw over a block, as shown in sketch, clamping the saw down at each side of braze. Now file and dress braze, always using the file lengthwise the saw. If he will be careful to not file too much where it is not needed, but leave the braze the same thickness as the saw, then levels it and puts in braze the same even tension as in saw, making the back edge perfectly straight, he will not have much trouble with cracked brazes, for they will last, provided good care is taken of them, until the saw is worn out.



FINISHING A BRAZE.

# Foreign Markets

## BRITISH MARKET FOR WOOD SPECIALTIES.

London, S. W., 10th August, 1899.

Editor Canada Lumberman :

Dear Sir,—As to the demand in the United Kingdom for special stock such as broom handles, skewers, cloth boards, etc., I should judge from what I constantly learn from the trade that woodenware and turnery generally are lines in which Canada should be destined to do a large business in this market. At present large quantities of these articles are supplied by the United States, and in certain lines the Americans practically control the United Kingdom market.

With the gradual increase of population, the consequent growth of the domestic demand and the steady consumption of the available supplies of timber, the opinion is largely held here that, the United States will in the near future be less favorably situated for supplying the extensive and also increasing demands of the United Kingdom for goods of the description which you enumerate. A certain amount of trade is, I understand, already done by Canadian exporters in this country, and they will consequently be familiar with the general conditions and main features of the situation. A more extended study, however, of the requirements of this market can safely be recommended to the many Canadians who have facilities at present, but slightly developed, for producing such articles as chair parts, furniture, mouldings, skewers, etc., for which the demand may almost be said to be unlimited.

The trade can be generally described as one of large outputs sold upon a very slender margin of profit. Many of the American manufacturers have resident agents who handle the goods in cargoes and in some cases these goods are worked on the trust system. I am told that in most lines it would be absolutely necessary that the Canadian exporter should have facilities for a large and regular output in order that trade could be at all profitable. Competition is very keen and prices are often at a level which can only render a very low profit to the producer. It is also very essential that any Canadian house entering into this business should place its interests in the proper hands. From past experience I should judge that some of the exporters are too anxious to endeavor to do business direct with the consumer or retailer, whereas the greater bulk of the trade is wholly in the hands of large importers and merchants forming a very extensive connection. There are of course some few exceptions, but I should think that nearly all the largest retailers and consumers obtain their supplies through residential agents or merchants. Canadian exporters would therefore either have to open a branch office in some favorable centre or arrange with some established firm of importers to represent them. At present various of the large houses are interested in United States goods, but there would be no difficulty in finding plenty of suitable merchants to take up and push Canadian goods. Inquiries indeed constantly reach me in reference to such matters.

Whilst in this connection it may be remarked that not only have these established houses a large connection and are thus able to deal with large shipments, but there would be constant and serious financial problems to be encountered by firms trying to deal direct with the consumer of which they would be relieved by the larger merchants.

It is a source of complaint from houses here who have handled Canadian goods that deliveries are apt to be very irregular and the quality, and particularly the finish of goods suffer by comparison with the United States product. Only recently I was personally shown some Canadian broom handles so imperfectly and roughly finished off as to be practically unsaleable.

During the past year or so a number of Canadian producers and British importers have been placed in communication with each other through this office, and inquiries have been made and preliminary reports furnished which leaves no doubt as to the possibilities of an extended trade being carried on. Latterly a considerable correspondence has been carried on in reference to birch chair parts for which there is a large demand here, and one firm at the moment is anxious to obtain large supplies of broom handles and mouldings.

Many of these importers constantly visit the United States and would doubtlessly be perfectly willing to extend their route so as to include Canadian houses which were really properly equipped for competing for a share of the trade. Undoubtedly preliminary personal intercourse is very desirable and arrangements could either be made in this manner or through the exporter visiting the United Kingdom and obtaining some personal experience of the conditions ruling here.

These few remarks have been penned for the benefit of the apparently numerous Canadians who have some idea in view of taking up the matter, and I shall at all times be very pleased to obtain any preliminary information for them which might be of assistance. Many houses already conduct large and increasing trade with this country as a result of personal enterprise, and there is plenty of room for others who set about the matter in a practical manner.

Yours faithfully,
Hainim Watson,
Curator Canadian Section Imperial Institute.

## THE JAPANESE LUMBER DEMAND.

Nagasaki, Japan, August 17th, 1899.

Editor Canada Lumberman :

Dear Sir,—The lumber trade at this port is not important, there being a much more extensive business carried on in Kobe and Yokohoma. Imported lumber at present is little used in Nagasaki, Japan, except for buildings erected on the foreign plan, consequently the demand is somewhat restricted. The government buildings, (offices, etc.), are now all put up in this style, but unless the Japanese use imported wood for their private houses and other work, the demand cannot be a large one. The higher rates, so long current on the Pacific coast, from whence supplies are drawn, as well as the difficulty of securing tonnage, has checked business effectually, and the imports for the year 1898, (at Nagasaki) totalled only yen 30312. There is, however, a growing enquiry, and it is probable that with lower prices a good trade may be encouraged.

Yours truly,
Holme, Ringer & Co.

---

Kobe, Japan, Aug. 23rd, 1899.

Editor Canada Lumberman :

Dear Sir,—Your favor of July 19th to hand asking for some information as to the Canadian lumber market here. Most of the lumber imported into Japan has come through us, but this business is very uncertain and spasmotic. It is difficult to build up a regular demand. The difficulty we experience mostly is being able to secure the exact measurements as demanded by the Japanese builders and contractors. Their measurements are peculiar to themselves, and unless shipments are exactly to order they are invariably refused. In our opinion, those who want to do the business with Japan must have their own mills here. We believe firmly that if one of the large lumber houses were to erect a small planing mill here and ship over a good lot of mill size lumber by cheap sail freight, and cut the wood here exactly to measurements as required by the Japanese, and cater directly for the Japanese trade, that they would build up a good paying business. The Japanese houses are built to a regular and unvarying Japanese scale, and which is totally different to ours.

We have suffered very much from the lack of attention to the details of measurements, and by having shipments thrown on our hands. There is a big business done here in case making, tea chests, etc. We have had many orders placed with us which in the aggregate comes to a considerable sum, but as each require different shipments and treatment, we find it impracticable to deal with them.

The largest field for lumber now undoubtedly is China, especially the north from Shanghai up, both for building and for railroad ties, if cheap enough to compete with the Japanese shiogi railroad sleeper. Measurements of sleepers wanted are 8′ x 9″ x 6″.

The current price for Oregon pine, rough, merchantable mill lengths is, U. S. gold, $22.00 per M cubic feet, c. i. f. Kobe, (by sail). There is a big bay here and good shore landing facilities. Kobe is central and feeds Oraka, Kioto and Nagasaki.

Yours faithfully,
A. J. McGlew & Co.

## DOMINION GOVERNMENT COMMISSIONER'S REPORT.

In the year 1897 Mr. George Anderson, of Toronto, was commissioned by the Dominion Government to visit Japan and report upon the trade openings that exist between that country and Canada. The following extracts are taken from his report :—

LUMBER.

The demand for lumber of all kinds is simply enormous, and this will certainly be one of Canada's largest exports to Japan, and the sawmills of British Columbia should be eager to supply the eastern trade. The Japanese are constantly building, their houses being constructed entirely of wood. The specifications sometimes asked for are large sizes and long lengths, as the contractors desire to cut by hand saw, into the sizes required for building. Douglas fir (British Columbia pine) is considered very satisfactory and cargoes of common lumber will find a market. There is also a large demand for large lumber for docks, ship-building, bridges and government works. The sizes required for railway ties are length, 7 feet, width, 8½ inches, depth, 4¾ inches. Pit props (round poles) for usé in coal mines, vary in size from 6 to 12 feet in length, and from 5 to 10 inches in diameter, the annual consumption running into hundreds of thousands of pieces. Lumber is also required for all kinds of packing cases, box shooks, tea boxes and other purposes. Ornamental wood, such as maple, oak, red cedar, &c., for wainscotting, panellings, ceilings and interior decoration of houses as well as for use in manufacturing furniture and railway carriages would find a ready market at good prices. The Japanese are exceedingly tasteful in the interior decorations of their residences. The forests in the main islands are considerably denuded and the government are insisting on the planting of trees for every one cut down. In quoting, Canadian correspondents cannot be too particular in showing the exact cost in gold at point of destination, and I would recommend sending a pro forma invoice naming price on rail of vessel at mill and showing freight, exchange, insurance and interest while in transit.

SHINGLES.

Are used extensively for roofing purposes, being nailed on the sheeting and then covered with mortar, tiles being put on over all. For this purpose No. 2 or 3 quality should find a very large sale. They are also used in the northern part of the Main Island and in Hokkaido, the Northern Island, in the same way as in our own country, with this difference, that bamboo strips are put across the row, the strips being held on by large flat stones, instead of each shingle being nailed. A better quality would be required for this latter purpose.

STAVES, HEADINGS, &C.

There is a very large number of people engaged in the cooperage business, manufacturing cement, sake and other barrels, tubs, firkins, pails and all classes of woodenware. Our large stave and heading manufacturers, who are shipping to other eastern countries, will, I am sure, find a large market in Japan, as the preparation of coopers' material by hand is very laborious work.

PULP.

Paper-making is a large industry in Japan, and wood pulp has already been received from Germany and Sweden. If satisfactory freight rates can be obatined, Canada can readily command this trade with the magnificent resources she possesses in this valuable product.

---

To commemorate the occasion of the thirtieth anniversary of the Ottawa Free Press, the publishers of that journal have issued an "Illustrated Book on Ottawa." The The work is devoted to a description of the prominent buildings and business establishments including the lumber mills, of the city of Ottawa and of the resources of the Ottawa valley. The letterpress is replete with excellen half-tone illustrations and portraits, and from every standpoint the book is deserving of praise. Not the least important feature of the book is a map showing the water powers of Ottawa and within a radius of 45 miles, which is issued under authority of the Board of Trade of Ottawa and cannot but assist in the further development of these powers. A copy of this booklet will be forwarded by the publishers on receipt of 50 cents.

ADVERTISING RATES FURNISHED ON APPLICATION

THE CANADA LUMBERMAN is published in the interests of the lumber trade and allied industries throughout the Dominion, being the only representative in Canada of this foremost branch of the commerce of this country. It aims at giving full and timely information on all subjects touching these interests, discussing these topics editorially and inviting free discussion by others.

Especial pains are taken to secure the latest and most trustworthy market quotations from various points throughout the world, so as to afford to the trade in Canada information on which it can rely in its operations.

Special correspondents in localities of importance present an accurate report not only of prices and the condition of the market, but also of other matters specially interesting to our readers. But correspondence is not only welcome, but is invited from all who have any information to communicate or subjects to discuss relating to the trade or in any way affecting it. Even when we may not be able to agree with the writers we will give them a fair opportunity for free discussion as the best means of eliciting the truth. Any items of interest are particularly requested, for even if not of great importance individually they contribute to a fund of information from which general results are obtained.

Advertisers will receive careful attention and liberal treatment. We need not point out that for many the CANADA LUMBERMAN, with its special class of readers, is not only an exceptionally good medium for securing publicity, but is indispensable for those who would bring themselves before the notice of that class. Special attention is directed to "WANTED" and "FOR SALE" advertisements, which will be inserted in a conspicuous position at the uniform price of 15 cents per line for each insertion. Announcements of this character will be subject to a discount of 25 per cent. if ordered for four successive issues or longer.

Subscribers will find the small amount they pay for the CANADA LUMBERMAN quite insignificant as compared with its value to them. There is not an individual in the trade, or specially interested in it, who should not be on our list, thus obtaining the present benefit and aiding and encouraging us to render it even more complete.

## WESTERN CANADA EDITION.

IN November, 1896, the CANADA LUMBERMAN presented to its readers a large amount of information relative to the timber resources and manufacturing facilities of Eastern Canada, embracing the Provinces of Quebec, New Brunswick and Nova Scotia. The number in which this data was published met with a most favorable reception at the hands of the trade throughout Canada, Europe, South America and the West Indies.

Early last June one of our commissioners visited the lumbering district in the neighborhood of Port Arthur, as well as the principal points in Manitoba, the North-West Territories and British Columbia, with the object of gathering information regarding the timber industry of Western Canada. The results of his enquiries are presented in the present number, which will be widely circulated at home and abroad, will, we trust, be read with interest and profit, and assist to further develop the already important and rapidly growing trade in timber products of our western territory.

The advertisement pages form a valuable supplement to the reading pages of this number, and will repay careful examination. They contain the names, addresses and announcements of the leading manufacturers and dealers in the territory mentioned. To the many firms and individuals in the west who have generously assisted us in the preparation of this number our most sincere thanks are tendered.

## ADVANTAGES OF ORGANIZATION.

Without appearing to encourage the formation of trusts and combines having for their object the control of the market and exorbitant prices, it may be said that the advantages of organization in the various branches of industry are now generally admitted. For some reason, however, there is an unaccountable lack of organization in the lumber trade of Canada. In the provinces of Quebec, New Brunswick and Nova Scotia no real association of lumbermen is in existence, and this notwithstanding the large number of persons engaged in the trade in this territory. In Ontario peculiar circumstances brought to life within the last two years the Ontario Lumbermen's Association, and we may express the hope that it will continue to wield its influence upon the lumber trade of that province. In British Columbia there is no association, some of the manufacturers, however, being honorary members of the Western Retail Lumbermen's Association of Manitoba. To this latter association belongs the distinction of having been in existence for a longer period than any other lumber association in Canada, and also of having a greater membership. The result of the working of this association stands out as an example of what may be accomplished by careful and thorough organization.

The membership of the Western Retail Lumbermen's Association is steadily increasing. At the time of organization it was intended to confine it to the lumber dealers of the province of Manitoba. The advantages accruing to the retail dealer from membership in the association becoming apparent to many of the lumber dealers of the Territories, some of them repeatedly made application for membership, and eventually the directors decided to extend the district as far west as Fort Qu'Appelle. Then dealers as far west as Moose Jaw made application and were subsequently accepted as members, and to-day the membership of the association extends north from Regina to Prince Albert and along the Edmonton Railway to Edmonton, embracing nearly all the retail dealers in the territory covered by the association. A dealer in the Alberta district, in making application for membership, states: "We have decided to take the step, and are confident that we can get nearly all the retail dealers in the district to become members; there is too much selling in car lots to consumers at wholesale rates by the mill men here, and all dealers feel that an injustice is being done them."

These facts are given to the lumber trade of Canada with the purpose of showing the growth of the Western Association, and how far it is appreciated by its members and of benefit to the trade.

We are informed that the success of the Association has been due in great measure to the loyalty of the honorary members in selling only to active members, in accordance with the by-laws of the Association. The advantages of the Association are that it has prevented the establishment of more than a reasonable number of yards at a given point, and has enabled the dealers to keep in stock a better assortment of lumber. Under this method of doing business, there have been absolutely no failures among members of the Association, and manufacturers have therefore suffered no financial losses.

There seems no reason why an association organized on the above lines, but with such changes as local conditions might demand, would not be a success in other provinces of the Dominion. There is a great field for organization, not alone among dealers, but among manufacturers as well.

## WHAT TIME HAS DEMONSTRATED.

The few opponents in Ontario of the manufacturing clause compelling the manufacture of timber within the province have advanced two main arguments—first, that the value of standing timber would be depreciated, and second, that the saw milling industry in the province would be crippled. An answer to these arguments may now be given from the experience of the past six months.

The first public sale of timber limits to be held since the enactment of the manufacturing clause, took place at Ottawa on September 5th, when the limits of the late firm of Hale & Booth were disposed of at auction. The most valuable parcel was berth No. 82, on the north shore of Lake Huron, containing an area of 36 square miles. This limit was purchased by Mr. Thos. Pitts, of Bay City, Mich., with whom is associated, it is understood, Mr. John Charlton. The price paid was $315,000, or $8,750 per square mile. A few years ago, and long before the manufacturing clause was in force, this berth was purchased by Hale & Booth from the Muskoka Mill & Lumber Company for a sum understood to be $285,000. Since that time most of the pine timber on 15 square miles of the limit has been cut off, leaving only 21 square miles of virgin timber. It will be seen that the price now paid is somewhat higher than that at which the limit was purchased some years ago, making no allowance for the timber which has been taken from it.

The figure realized also makes a most satisfactory showing when compared with the prices obtained at Government sales. The highest price ever paid for the right to cut timber on Crown lands was in 1892, when the Gilmour Company, of Trenton, paid $205,625, or $17,500 per square mile, for a berth of 11 3-4 square miles in the township of Peck. Although this limit was an exceedingly valuable one, it was generally believed that the price paid for it was above the current value of the timber. At this sale a limit of 35 1-4 square miles was purchased by Geo. W. Pack, of Alpena, Mich., at the price of $10,600 per mile. At the government sale of 1887, $6,350 per mile, and at the sale of 1897 $6,600 per mile, were the highest prices obtained. Except in the two cases above mentioned, no timber has ever been sold by public competition at as high a figure as that realized at the late sale of the Hale & Booth limits. These facts, we think, effectually dispose of the argument that the value of timber limits would be appreciably reduced by compelling home manufacture of the timber. It is indeed singular, and unexpected that in the face of the existing conditions Michigan manufacturers should still compete for our timber limits. No better illustration could be given of the value of our timber resources.

The season for manufacturing lumber is now drawing to a close. In the Georgian Bay district the year has been one of the most prosperous in the history of the trade, mills that had

been closed down for years having resumed operations, and all being taxed to their utmost capacity to supply the demand for lumber. Some of these mills have been cutting on logs taken from limits owned by Michigan lumbermen. Indications point to a season of still greater activity next year. We understand, on reliable authority, that several of the Michigan lumbermen have made arrangements for logging operations this winter on their Georgian Bay limits, and that if unsuccessful in their attempt to secure the abrogation of the Ontario Legislation, they will manufacture the logs in Ontario. The result of this will be that new mills will be erected on the Georgian Bay, and that the industry will flourish under the new regulation which, instead of crippling the business, has brought to it increased activity.

Apropos of this subject, we observe that the Michigan lumbermen have filed a petition of right at Osgoode Hall, Toronto, preliminary to commencing an action for damages against the Ontario Government. The Government has also filed its defence, in which it is pointed out that all licenses granted are to be subjected to such conditions, regulations and restrictions as may be established, and that no such license shall be granted for a longer period than twelve months. Granting that the courts should decide that the Michigan lumbermen are entitled to be recompensed, the people of Ontario will, as we have before stated, back up the Government in paying the amount of damages decided upon, such is the satisfaction given by the law prohibiting the exportation of saw logs.

## A WRONG TO BE RIGHTED.

The thanks of the lumber trade of Canada are due to the Hon. R. R. Dobell, of Quebec, for the efforts which he has recently made to secure the removal of the discriminating insurance rates recently imposed by the British Underwriters on shipments of timber products from Canadian ports. Through Mr. Dobell's influence a meeting was recently held in the London Chamber of Commerce to consider this subject. Mr. Dobell addressed the meeting at considerable length and presented arguments to show that the dangers attending ships using the St. Lawrence route are not of a character to justify the discrimination in insurance above referred to. This discrimination in the case of a steamer valued at £23,000 amounted to £1, 1s. per cent. additional premium and an extra charge of £1, 1s. per cent. if the vessel left England for Canada later than the first of September. Mr. Dobell stated that his firm had now under charter a steamer from the United Kingdom to Quebec on which the sum of £700 extra charges must be paid above what would be necessary if the steamer were sent to Bangor, Maine, instead of to Quebec.

As proof of the reasonable safety attending shipments of lumber from Quebec by the St. Lawrence, Mr. Dobell stated that out of 240 steamers loaded by his firm in 1898 only one was lost, while of the 190 steamers employed to date this year no loss had occurred. In support of his argument for the removal of the discriminating charges, Mr. Dobell referred to the improvements which have recently been made and are proposed to be made by the Canadian government to insure the safety of vessels traversing the St. Lawrence. Among these may be mentioned the placing of a powerful fog siren on the north-east side of Belle Isle, the building of an additional lighthouse on the coast of Newfoundland, and the replacing of two light ships at the narrow channel known as The Traverse, by a permanent lighthouse. In this connection it should be mentioned that the Hon. Mr. Tarte, Minister of Public Works, on his return from Europe recently, stated that such further improvements as may be required to perfectly insure the safety of vessels on the St. Lawrence will be carried out in the near future. Some of the losses which have occurred in the past have been due to excessive deck loads, but as was intimated by Mr. Dobell this cause of accident has been eliminated by the bill passed at the last session of the Canadian Parliament which makes it compulsory for every vessel to have her deck load passed by the port warden, or in the absence of such an official, provision is being made for some expert to supervise the various ports to see that ships are properly loaded. Mr. Dobell made timely reference to the fact that with the deepening of the canals the natural tendency of shipping from the Northwestern States and the Canadian Northwest would be to pass down the St. Lawrence, consequently it was of the utmost importance that no obstacle should be placed in the way of trade development having such an important bearing on the prosperity of Canada and the promotion of trade intercourse between the Dominion and Great Britain.

A resolution was passed at this meeting urging the insurance authorities to amend the present regulations in such a way as to remove the disadvantages imposed on the Canadian trade. It was further resolved that another meeting should be held at a future date to further discuss the question in the light of additional information which can no doubt be obtained and presented. It would strengthen the arguments advanced by Mr. Dobell if statistics could be presented to the insurance authorities showing the losses on vessels and cargoes from Canadian ports for a given number of years as compared with vessels in the same line of trade carrying shipments from other countries ; also what proportion of such losses were due to the practice of overloading decks.

This is one of the most important questions affecting the Canadian export trade in many lines that has ever arisen. Every effort should be made by the Canadian government aud those interested in the trade development of Canada to bring about a more satisfactory condition of affairs at as early a date as possible. The recent disaster to the steamer " Scotsman" is likely to strengthen the prejudice which already prevails among British insurance authorities against the St. Lawrence route. Therefore the causes which led to this accident should be made the subject of careful inquiry, so that it may be definitely known whether the disaster was due to lack of proper marine safeguards or to carelessness or error of judgment on the part of the officers in command of the ship. If anything is required to make the St. Lawrence route safe for shipping, the necessary improvements should be made without delay. On the other hand, if this route is now up-to-date in this particular, evidence of the fact should be put in the clearest possible form before the insurance authorities and a persistent effort made to have the charges on vessels coming to Canada put on an equality with those imposed upon vessels loading for American and other ports. The large expenditures made by the Dominion government in recent years for the improvement of the canals with the object of attracting to the St. Lawrence route the immense shipping trade of the North West, will be to a large extent nullified if the present discrimination in insurance rates is allowed to continue.

## EDITORIAL NOTES.

Tangible proof of the improved commercial conditions prevailing, particularly in the lumber trade, is found in the large number of timber properties which are now on the market in Canada and the United States. The value of some of these properties which have recently been brought to our notice is over one million dollars. Developments will be watched by the financial world with much interest.

The cost of logging operations during the coming winter will be considerably greater than for several years past. From every section of the Dominion comes the report that woodmen are being engaged at wages much higher than last year, in some instances the increase being as great as five dollars per month. It is not alone this one factor however. Practically everything pertaining to lumbering, such as food, axes, logging chains, and other supplies are selling at higher figures. It is well for lumbermen to fully reckon upon these advances, which must necessarily increase the cost of lumber, and also to give due consideration to the possibility of lumber prices weakening in the spring of 1900. The precaution which we would advise is to operate moderately, and seek to make a fair margin of profit on a limited production, and at the same time assist to maintain the strength of the market.

The Canada Lumberman has received an inquiry for the address of the manufacturers of a of a boiler specially built for putting steam on snow roads, to assist the transportation of sleds. So far as can be learned, there is no special sprinkler in use in Canada for making logging roads. We understand that some lumbermen have adopted the method of sprinkling the roads, but that the sprinkler is usually a home-made contrivance. Mr. J. R. Booth, of Ottawa, employs an ordinary box about 16 feet long, six feet wide, and four or five feet high, with two holes in the rear end to allow the water to escape onto the sleigh track. It is necessary, of course, to use the plough in advance of this in making the road, but when the road is once made, all that is required is to run the sprinkler over at the close of each day's work to keep it in running order. Should a more improved sprinkler be in use in any part of Canada, The Lumberman would be pleased to be furnished with particulars.

# British Columbia

## THE TIMBER RESOURCES AND THEIR DEVELOPMENT.

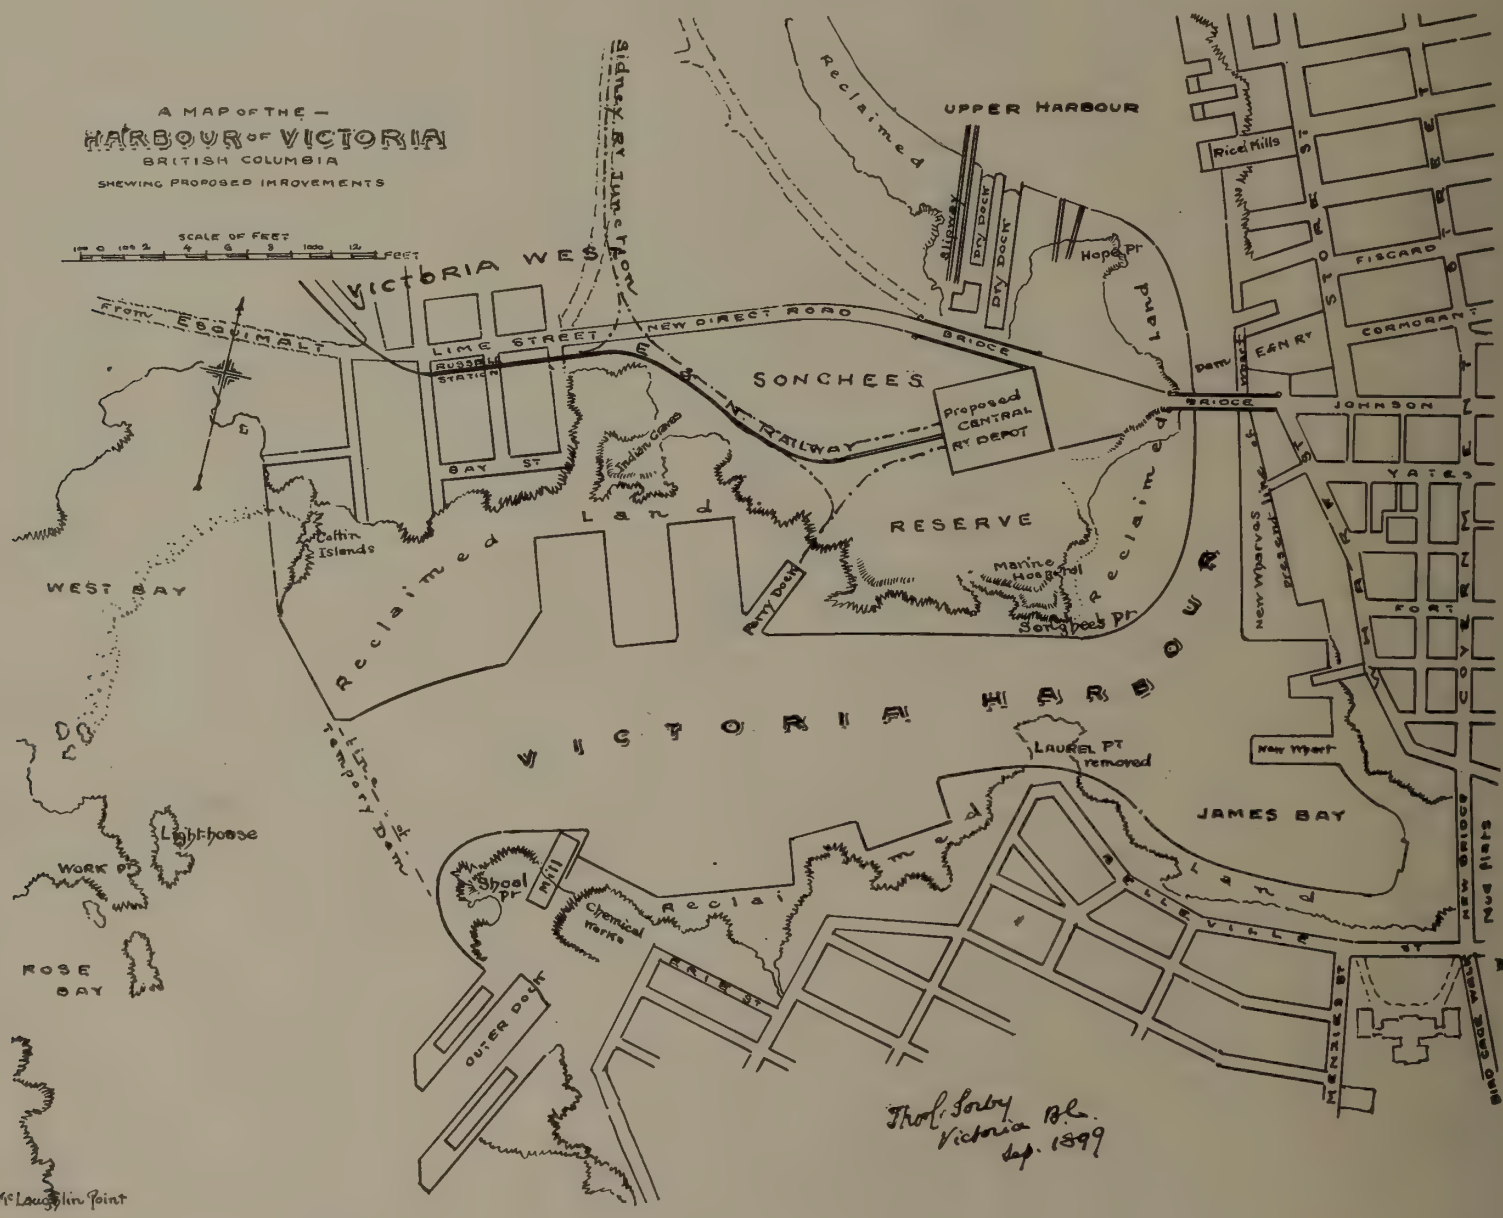
A CONSIDERATION of the natural sources of wealth possessed by the Province of British Columbia leads very quickly to a view of the forest wealth of the province, which may be said to include the greatest area of merchantable timber in Canada and possibly on the continent of North America. Great as the area still is, it would have been much greater but for the destructive forest fires which raged in the interior in the early years, when the preliminary stages of development were in progress. The loss of wealth by this destruction of timber, while very great, is, however regrettable, an exigency that could hardly have been provided against owing to the unsettled state of the country and the rugged character of its surface.

As the greater portion of the choice timber areas and those most accessible, are contiguous to the coast or on the lower levels of the province, the effect on the supply is not noticeable. The ravages of fire never have been nor can be as serious or widely spread in these portions of the province, owing to the humidity of the climate and the dense growth of the timber. So slow, too, has been the extension of the industry of turning the timber wealth of the country into merchantable commodity, it is not nearly equal to the increase, actual or theoretical, of the timber by growth.

The development of the mining industry which has been much more extensive in the interior than on the coast, has been a factor in the destruction of timber of correspondingly greater influence.

Despite the losses by fire that have depleted the forests of British Columbia, to-day the timber resources form a vast treasure house of wealth which remains to be drawn on for generations to give support and employment to an ever-increasing population. To conserve this vast wealth and at the same time to develop it to the greatest possible extent for the enrichment of the people will be an important subject for the intelligent citizens to study.

By her geographical position situated close to the vast treeless plains of the North-west Territories and Manitoba, the province of British Columbia is, in a measure, curator of this great timber not only for her own enrichment but for the industrial necessities of the sister provinces, which are year by year increasing in population to an extent that will soon bring the weight of numbers in the broad Dominion, west of the Great Lakes. For their timber supplies the whole of this great western territory will in time be entirely dependent upon the store-house of this province, as indeed some considerable parts are now. In spite of inventions and the use of metals in the industrial world, wood has held its place and apparently will continue to do so, and, as the prairie provinces to which reference has just been made are almost purely agricultural, their demands for lumber will always be large.



## THE EXPORT TRADE.

While not forgetting the home market, which is thus assured to the product of British Columbia forests, and which is already a customer for a large percentage of the present output of our mills, it is well to turn to the export trade, which offers not a future but a present large and growing market, and the proper fostering of which

# CANADA LUMBERMAN

## WEEKLY EDITION

The Lumberman Monthly Edition, 20 pages } $1.00 PER YEAR { The Lumberman Weekly Edition, every Wednesday

*THIS PAPER REACHES REGULARLY THE PRINCIPAL LUMBER MANUFACTURERS AND DEALERS THROUGHOUT CANADA, AND WHOLESALE BUYERS IN GREAT BRITAIN, THE UNITED STATES, AND OTHER FOREIGN MARKETS.*

VOL. V. TORONTO, ONT., OCTOBER 18, 1899 No. 39.

## CANADA LUMBERMAN

PUBLISHED BY

**The G. H. Mortimer Publishing Co'y of Toronto, Limited**

*Confederation Life Building - TORONTO.*

Branch Office:
NEW YORK LIFE INSURANCE BUILDING, MONTREAL.

**Weekly Lumberman,** published every Wednesday. Contains reliable and up-to-date market conditions and endencies in the principal manufacturing districts and leading domestic and foreign wholesale markets. A weekly medium of information and communication between Canadian timber and lumber manufacturers and exporters and the purchasers of timber products at home and abroad.

**Lumberman,** Monthly. A 20-page journal, discussing fully and impartially subjects pertinent to the lumber and wood-working industries. Contains interviews with prominent members of the trade, and character sketches and portraits of leading lumbermen. Its special articles on technical and mechanical subjects are especially valuable to saw mill and planing mill men and manufacturers of lumber products.

☞ Subscription price for the two editions for one year, $1.00.

## WANTED AND FOR SALE

Advertisements will be inserted in this department at the rate of 15 cents per line each insertion. When four or more consecutive insertions are ordered a discount of 25 per cent. will be allowed. This notice shows the width of the line and is set in Nonpareil type; 12 lines make one inch. Advertisements must be received not later than 4 o'clock p.m. on Tuesday to insure insertion in the current week's issue.

FOR SALE.—A few thousand set of Basswood Heading, No 1, mill run, and No. 2, 17⅛. For particulars apply to GEO. M. EVEREST, Arkona Basket Factory.

FOR SALE.

BIRCH FLOORING, KILN DRIED, HOLLOW backed, butted and bundled—suitable for factories, workshops, etc. The KNIGHT BROS. Co., Burks Falls, Ont.

FOR SALE.

60 M FT. 1 INCH BEECH; 40 M FT. 1¼ INCH Beech; 8 M ft. 2 inch Beech, common and better, cut last winter. Delivery on cars at Shallow Lake and Wiarton. Write J. E. MURPHY, Hepworth Station, Ont.

WANTED.

LOT OF BASSWOOD OR SPRUCE BOLTS, six inches and up in diameter, forty-eight inches long. Quote lowest cash prices. J. F. STENGEL, Ellicott Square, Buffalo, N.Y.

FOR SALE—STEAM SAW MILL,

WITH PLANER AND SHINGLER, IN operation, near C.P.R. line to Labelle, P.Q. Capacity 12,000. Plenty of Spruce and Birch available at lowest prices. Good local trade. Everything first class. Apply c/o E. DESBARATS ADVERTISING AGENCY, Montreal.

## FOR SALE

TORONTO LUMBER BUSINESS AND PLANing Mill, Dry Kiln, etc. Splendid complete outfit, large busines now done.

Substantial part of purchase money may remain invested if desired by purchaser. Apply,

DENTON, DUNN & BOULTBEE, Solicitors,
Temple Building, Toronto.

SAW MILL FOR SALE.

THIRTY-FIVE HUNDRED DOLLARS BUYS Saw mill worth double this amount, if taken at once; 2 Boilers 120 h.p., Engine 100 h.p., Iron Saw Frame, Three Block Carriage, 2 good Saws, Double Edger and Trimmer good as new, Slash Chain, all in good running order, run this season; size of Mill, 30×100 ft.; good Boiler House, Blacksmith Shop, House, Barn, etc.; 400 acres of good Birch and Hemlock, also housands of acres of timber near by. For particulars, ddress ALLEN CRESSMAN, Berlin, Ont.

WANTED.

TO BUY A GOOD SECOND HAND SAW MILL of capacity about 20,000 feet per day. Apply to GODERICH LUMBER CO., Goderich, Ont.

FOR SALE.

BAND RE-SAW, DOUBLE SURFACER AND Matcher, Four Side Moulder, Sash Sticker, 50 h.p. Boiler and Engine all in good repair. TORONTO MACHINERY SUPPLY CO. Toronto.

WANTED.

CORDWOOD, BEECH, MAPLE, OAK OR Ash, dry, and Hardwood Slabs; Lath, Shingles and Lumber. Address, NORTHSIDE LUMBER & COAL CO., 860 Greenwood Avenue, Detroit, Mich.

WANTED.

THE UNDERSIGNED INVITES CORRESpondence from Canadian manufacturers who can supply in large quantity Canadian Pine Doors and Windows. Goods must be of first-class quality as to material and manufacture. Address, HARRY G. BOYCE, Atheneum Chambers, 70 Temple Row, Birmingham, England.

## PINE AND HARDWOOD WANTED

AN ENGLISH FIRM WHO ARE LARGE buyers of Pine, Oak and Soft Elm, 1-inch boards, 6½ or 7 foot lengths, invite quotations from Canadian manufacturers, free on board winter port, for the following:

| | | | | | | |
|---|---|---|---|---|---|---|
| 12 in. | wide at one end, | tapering to | 10 in. | at other end. | | |
| 13 | " | " | " | 11 | " | " |
| 14 | " | " | " | 12 | " | " |
| 15 | " | " | " | 13 | " | " |

Must be dry, first class, clean grade wood, free from splits, shakes, etc. Address, BOX 100, CANADA LUMBERMAN.

## AUCTION SALE OF VALUABLE

# Timber Berths

AT THE ROTUNDA OF THE BOARD OF TRADE, TORONTO, ON

## Tuesday, October 24th Next,

AT 2 P. M.

**Timber Berths Nos. 94, 98, 99, and 102**

(North Shore of Lake Huron District), and known as the Townships of

## Trill, Ermatinger, Foster, and Nairn

on the Spanish River and tributaries.

TRILL and ERMATINGER will be sold in single Berths of 36 square miles each, and FOSTER and NAIRN in 9 square mile parcels of N.W. ¼, N.E ¼, S.W. ¼, and S.E. ¼, respectively.

These Berths have never been operated on, and are heavily timbered with superior

**PINE AND OTHER WOODS.**

For terms of sale, maps and other particulars apply to E. R. C. CLARKSON, Ontario Bank Chambers, or to

PETER RYAN,
Toronto.

## BY INSTRUCTIONS FROM BARNET & MACKIE

At the termination of the sale of the Comstock Timber Berths I will offer for sale

**Timber Berths Nos. 5 and 6,**

Township of Butt, being 11¼ and 11 Square Miles respectively, in one lot.

The logs from these Berths can be driven to the Georgian Bay by the Magnetawan.

For further particulars apply to A. BARNET, Renfrew.

PETER RYAN.

# Saw Mill for Sale

Well situated in the rapidly growing CITY OF VANCOUVER, B.C.; consisting of valuable freehold property, with modern well equipped Mill, having a capacity of about 75,000 feet per day of ten hours.

Also about 10,000 Acres of good

## Timber Limits

INCLUDING

**DOUGLAS FIR, SPRUCE and RED CEDAR**

Easy of access and can be cheaply logged.

For price and terms apply to

**The BRITISH COLUMBIA LAND & INVESTMENT AGENCY, Limited,**
VANCOUVER or VICTORIA, B.C.

FOR SALE.—Saw and Planing Mill, 40 h.p, doing a good local and shipping trade. The above will be sold at a reasonable figure. KNECHTEL & YOUNG, Turtle Lake, Parry Sound District.

## CURRENT TRADE CONDITIONS.

### ONTARIO.

So far October has been an active month in the lumber business, but there are signs that the trade is settling down to a winter basis. Some of the mills are closing down, while others will operate for some weeks yet. Reports are but a repetition of low stocks, so that no weakening of the market is likely to result from a falling off in demand. The winter requirement for local manufacturing purposes is certain to be quite up to the average, if indeed it is not considerably greater. The position of stocks in the Eastern States is such that a demand from that quarter is assured, particularly for low grade lumber, of which there is a great scarcity. Under these conditions, it is the general opinion that the sawing season of 1900 will open with stocks of pine lumber lower than they have been for years. The hardwood situation has not changed; stock is scarce and difficult of purchase. Complaint is made, not without foundation, we believe, that the margin between the manufacturer's price and that which can be obtained from the consumer is too limited; in other words, the manufacturer has taken every advantage of the improved demand, while the dealer has had great difficulty in educating the retailer and consumer as to the full extent of the advance in prices. It is a question if prices of hardwood lumber have not in some instances been advanced too rapidly.

### QUEBEC AND NEW BRUNSWICK.

An event of more than usual interest to the lumber trade of Montreal was the awarding last week of the contract for the timber required for proposed harbor improvements to be carried out next year. The contract is one of the most important which has been given out for some time time, representing a figure well up to one hundred thousand dollars. The competition was quite keen, the successful tenderers being the Shearer & Brown Company, who submitted a bulk tender. Apart from this contract, trade is generally quiet. A few vessels are loading and under charter for the British market, although the quantity which will go forward between now and the close of navigation will be small. The month of September showed a falling off in shipments of lumber from Montreal of $407,143, as compared with same month in 1898, the value for the two months being $1,321,436 and $914,293 respectively. Reports from New Brunswick state that there is very little stock in the hands of manufacturers. Such stocks of British deals as are still held on this side are in the hands of shippers, who may possibly hold them over for spring shipment on account of the scarcity of vessels and high freights. The rate from St. John to the west coast of England is 52s 6d to 55s. Two steamers have been chartered at the latter figure, which is the highest rate paid so far this season. There is good enquiry for lumber tonnage from Nova Scotia and New Brunswick to the West Indies and South America.

### MANITOBA AND BRITISH COLUMBIA.

A brisk movement of lumber is reported from Manitoba and the Territories. A number of new buildings and improvements have just been commenced, and most of the finishing work will be done during the winter months, thus keeping up the demand for lumber. The mills in British Columbia are so busy with local and eastern trade that, with one or two exceptions, export business is receiving little attention. Several of the mills are shipping lumber to Cascade City and other northern points to be used for building purposes. Shingle manufacturers are likewise experiencing a heavy demand for their product.

### UNITED STATES.

The movement of lumber in the United States has shown a slight falling off dur-

ing the past week. This has been due to two causes, first, the indisposition of retail dealers to stock up at the present prices, and second, the high freight rates ruling. There appears to be an opinion among retail dealers that prices will weaken during the winter months, but in contravention of this it is pointed out that so far as white pine is concerned, the mills are receiving enquiries for stock to be delivered next season at the prices prevailing at the present time. Freights from Duluth to Buffalo have advanced from $4 to $4.50, and as a consequence the dealers are only bringing down such lumber as must be moved. The feature of the pine market is the active demand for the coarser grades. That most enquired for at Buffalo, Tonawanda and other eastern markets is 1×10 and 1×12 inch box and No. 3 barn. The scarcity in the east of cheap cutting-up stock is such that sash, door and blind manufacturers may be forced to use higher priced lumber. There is also a reported scarcity of spruce, and manufacturers are realizing high prices. It is impossible to point out any material change in the hardwood trade. The demand has not abated, while stock is getting scarcer. Prices are stationary, and if any advances are made, they are likely to be of a moderate character. The shingle market is firm, with some possibility of an advance in the near future. New Brunswick cedar shingles of No. 1 quality are selling in Boston at $3.25.

FOREIGN.

The wood trade of Great Britain is now giving some attention to next year's shipments, although as yet little business, if any, has been concluded. Shippers are said to be asking higher prices, and there are indications that deals will be higher, while battens will remain about the same. It is expected that a large amount of business will be transacted before the close of the year.

Within the past fortnight there have been several advances in pine and spruce deals. At London 3×11 first pine is selling at £26 to £26 10s per standard and 3×11 first spruce at £14, while 3×11 third spruce makes £9, and 3×9 £8 10s. These are the prices paid by retail dealers and large consumers. There is a scarcity of broad first pine deals in brokers' hands. One parcel of four inch, principally 15 inches wide, is reported to have been sold at £28 17s 6d per standard. Long lengths of spruce deals, 18 feet and up, 9×3, are also scarce. Waney and square pine timber is rather quiet, although prices remain firm. The demand for Quebec oak and elm is good.

STOCKS AND PRICES.

No. 1 pine lath is now quoted at Minneapolis at $3.75.

The Pembroke Lumber Co. will get out about 40,000 logs on their Dumoine limit this winter.

A cargo of spruce deals has just been purchased at £7 per standard delivered at a Lancashire port.

It is reported that the cut of logs in the state of Maine during the coming winter will be unusually large.

The steamer Manitinea sailed from St. John, N. B., last week for a British port, with 2,621,000 feet of deals, shipped by W. M. Mackay.

The Dickson Co., of Peterboro, purpose operating this winter on the old Scott limits north of Ball lake, employing nearly 500 men.

S. A. Marks, of Thessalon, Ont., wants offers for taking off and delivering on bank of Thessalon river 160,000 feet pine timber, 8,000 ties, and 250 cords of wood.

It was recently reported that Montgomery Bros. & Co., of Buffalo, had purchased 20,000,000 feet of lumber at Midland and other Georgian Bay points. A later report states that the quantity was only 9,000,000 feet.

Joseph Turner, of Bay City, Mich., is having 25,000,000 feet of lumber manufactured in Ontario this season, and expects to cut 50,000,000 feet of logs this winter. He recently sold 1,000,000 feet of mill culls to the Michigan Manufacturing Co. at $8, which, with the freight and $2 duty added, made the cost $12 f.o.b. Bay City.

The Bell Telephone Co., through Mr. F. G. Walsh, superintendent at Winnipeg, are asking for tenders for the supply of 4,000 cedar poles, 25 feet in length, with 7-inch tops, delivered between Portage la Prairie and Winnipeg.

Lath are quoted at Saginaw, Mich., at $3.75 and $4 in wholesale lots and $4.50 in car lots. Lumber prices have an upward tendency. An offer is noted of $13.50 for mill culls, but the lot must have been above the average in quality.

The schooner Ella Sayer sailed from Quebec on October 13th for London, with a cargo of deals, shipped by H. R. Goodday & Co. The bark Rebekah Crowell sailed on the same day for Yarmouth, England, with a lumber cargo, shipped by Dobell, Beckett & Co. The steamship Abbey Holme is loading a wood cargo at Quebec for the United Kingdom.

An important lumber contract was awarded in Montreal last week, it being for the annual supply of timber for the harbor works to be constructed during the year 1900. The successful tenderers were the Shearer & Brown Co, at $92,726.32. The W. H. Kelly Lumber Co. tendered at $79,185.19, or $13,541.13 lower than the Shearer & Brown Co., but an accepted cheque did not accompany the tender, and on this ground it was ruled out.

Several timber berths were sold at the crown lands office, Fredericton, N. B., last week, to the following parties: J. E. Moore, St. John, six births on Maguadavic river, Shin creek, Rickelegan river and Kedin lake, at upset price; Hugh McLean & Tate, two mile berth on South Salmon river, $21 per mile; A. C. Estabrooks, two mile block in Farnham, Sunbury county, at $20 per mile; Timothy Lynch, two mile berth at head of Northwest Branch Little S. W. Miramichi, at upset price; Frank Todd, two mile block on West Magaguadavic river, at $8.10 per mile.

A meeting of hardwood lumber manufacturers was held at Traverse City, Mich., recently, to complete the reorganization of the Michigan Hardwood Lumber Association. It was generally agreed that the following prices for hardwood lumber should rule: Log run — 1-inch, $14; grades, mill culls, $6; shipping cull, $7.50; common, $12.50; firsts and seconds, $17.50; 1¼-inch, $18; 1½-inch, $19; 2-inch, $20; 2½-inch, $21; 3-inch, $22.50; 3½-inch, $23; 4-inch, $24. Common—1¼-inch, $12; 1½ inch, $12.50; 2-inch, $13.50; 2¼-inch, $14; 3-inch, $15; 3½-inch, $15.50; 4-inch, $16.

Of the Barbados lumber market Messrs. S. P. Musson, Son & Co. say: There have been two arrivals of white pine, the Harold Borden, from Annapolis, N.S., with 142 M. ft., and the sch. Josie, from Calais, Me., with 90 M. ft. merchantable and 10 M. ft. 2nd quality white pine boards. This cargo was sold there, and re-sold here at $22 for shipping and $17 for 2nd quality. In spruce we continue our valuation of $17 or thereabouts. The Blenheim has arrived from Paspebiac with 1,200,000 long Gaspe cedar shingles, a small portion of which have been placed at $3.75; balance of cargo is being stored. The Josie also brought 724 M. cedar laying shingles, which were re-sold at $2.70. A lot of 200 M. have since been placed at $2.60.

WOOD STOCKS AT BRITISH PORTS.

The figures of the stocks of wood goods at some of the leading British ports on September 30th, in comparison with same date one year ago, shows that in nearly every line the supply is lighter. At the public docks at London the figures for the two years, respectively, are as follows:

| | 1898. | 1899. |
|---|---|---|
| Pine deals and battens, pieces | 1,697,000 | 1,469,000 |
| Spruce ditto | 1,647,000 | 1,187,000 |
| Oak timber, loads | 2,492 | 2,379 |
| Birch timber and planks, loads | 4,223 | 3,166 |
| Elm and ash timber, loads | 1,749 | 943 |
| Yellow pine, loads | 1,473 | 872 |
| Red pine, loads | 183 | 19 |

It will thus be seen that at London the stock of Canadian deals and timber of every class is less than one year ago.

The figures for the ports of Liverpool, Birkenhead, Garston, Saltport and Runcorn are as follows:

| | 1898. | 1899. |
|---|---|---|
| Quebec square pine, cubic feet | 87,000 | 61,000 |
| Quebec waney pine, cubic feet | 238,000 | 143,000 |
| Red pine, cubic feet | 17,000 | 5,000 |
| Oak, Canadian and U. S., cubic feet | 249,000 | 203,000 |
| Oak planks, cubic feet | 103,000 | 99,000 |
| Elm, cubic feet | 25 000 | 24,000 |
| Birch logs, cubic feet | 395,000 | 215,000 |
| Ash, cubic feet | 27,000 | 28,000 |
| N.B. etc., spruce deals, per std. / " pine " " | 25,075 | 20,896 |
| Quebec deals, per std | 19,859 | 17,667 |

These show that this year the stocks of square and waney pine, red pine, oak, elm and birch timber and New Brunswick and Quebec pine and spruce deals are less, and only in ash timber is there an increase.

The following figures show the stock of timber and deals in the Clyde on September 30th, 1898 and 1899:

| | 1898. | 1899. |
|---|---|---|
| 1st pine deals, standards | 2,436 | 1,178 |
| 2nd pine deals, stds | 916 | 521 |
| 3rd pine deals, stds | 4,760 | 2,460 |
| 4th pine deals, stds | 3,719 | 2,899 |
| 1st pine ends, stds | 821 | 360 |
| 2nd pine ends, stds | 116 | 16 |
| 3rd pine ends, stds | 74 | 60 |
| 4th pine ends, stds | 439 | 9 |
| Unassorted pine deals, planks and boards, stds | 1,866 | 1,476 |
| Red pine, etc, stds | 261 | 214 |
| Quebec spruce deals and boards, stds | 3,893 | 5,708 |
| Lower port spruce, stds | 7,050 | 6,871 |
| Lower port pine, stds | 1,868 | 1,146 |
| Oak planks and boards cubic feet | 30,258 | 64,454 |
| Birch planks and boards, cubic feet | 87,556 | 58,505 |
| Quebec waney and square pine, cu. ft. | 883,307 | 850,706 |
| Quebec elm, cubic feet | 143,883 | 106,289 |
| Quebec red pine, cubic feet | 44,139 | 94,245 |
| Quebec oak, cubic feet | 194,725 | 233,960 |
| Ash, cubic feet | 67,123 | 11,944 |
| Birch—logs, cubic feet | 46,518 | 69,493 |

In nearly every class of Canadian deals the stocks are considerably less than last year, although Quebec spruce deals and boards show an increase. Square and waney timber and elm, red pine, oak and ash timber are less in quantity, but birch logs show an increase of about 50 per cent.

THE GLASGOW MARKET.

Messrs. Wright, Graham & Co., in their last monthly report, review the timber market at Glasgow as follows:

A good consumption of most kinds of wood is going on. Stocks are moderate and prices on the whole are very firm. Shipbuilding returns show that the amount of new tonnage launched on the Clyde during this month is a record one, viz., 54,904 tons. New orders are reported placed for about 26,000 tons.

WANEY BOARDWOOD.—The demand is improving and prime wood is being held for advanced prices. Sales reported at 2s 6d to 2s 10d for large average; smaller average second class sold at 1s. 5d. to 2s. 3d. per cubic foot.

SQUARE PINE.—Only large prime wood is enquired for. Price 2s 4d to 2s 7d; smaller average and poorer quality 1s 5d to 2s per cubic foot.

RED PINE.—The demand keeps good for large average wood. Price 1s 10d to 2s; smaller wood at 1s 3d to 1s 6d per cubic foot.

OAK LOGS.—Large selected logs have been in demand. Price 2s 9d to 3s per cubic foot; smaller and poorer quality 2s to 2s 3d per cubic foot.

ELM LOGS.—There has been a specially good demand for large prime wood. Price 2s 3d to 2s 5d; smaller averages and second class at 1s 10d to 2s per cubic foot.

ASH LOGS.—The demand keeps active for prime parcels. 15 to 16 inch average 1s 10d to 2s; smaller average at 1s 8d to 1s 9d per cubic foot.

BIRCH LOGS.—They are in fair request. Price, 16 inch average and up, 1s 9d to 2s; 14 to 15 inch average at 1s 5d to 1s 7d per cubic foot.

ROCK MAPLE LOGS.—There is no demand. Price 1s 9d to 2s per cubic foot.

HICKORY LOGS.—There is good stock of ordinary quality on hand. Only selected second growth logs are wanted. Price 2s to 2s 3d per cubic foot. Ordinary quality is selling at 1s 8d to 1s 10d per cubic foot.

QUEBEC WHITE PINE DEALS.—The import has been moderate and sellers are holding for

advanced prices. Broad firsts are scarce and shipments meet with ready sale. Prices rule as follows :

1st quality broad, £24 15s to £26 2s 6d; 11 in. broad, £22 to £23 14s 4d ; 7 in. to 10 in. and ends, £17 3s 9d to £19 5s ; 2nd quality broad, £18 4s 4d to £19 5s ; 11 in. broad, £15 16s 3d to £17 3s 9d. ; 7 in. to 10 in., £13 15s to £14 15s 7d ; 3rd quality broad, £10 6s 3d to £11 ; 11 in. broad, £9 12s 6d to £9 19s 4d ; narrows, £7 4s 4d to £8 5s ; 4th quality broad, £7 11s 3d to £8 5s ; 11 in., £7 4s 4d to £7 11s 3d ; narrows, £6 10s 7d to £6 17s 6d.

Red Pine.—There is an exceptionally good demand, and consignments meet with ready sale at advanced prices. Prices are: 9 and 11 in. by 3 in., £10 6s 3d to £12 7s 6d ; narrows, £8 18s 9d to £9 12 6d.

Quebec White Pine Boards.—The demand is improving and prices are firmer. Quotations are as below :

First quality, 2 in. thick, 12 in. to 15 in. wide, £17 17s 6d to £19 11s ; 1½ in. thick, 12 in. to 15 in. wide, £17 3s 9d to £19 5s ; 1¼ in. thick, 11 in. to 13 in. wide, £16 16s to £18 11s 3d ; 1 in. thick, 10 to 12 in. wide, £15 16s 3d to £16 16s ; 1½ and 2 in strips, 4 in. to 7 in. wide, £14 15s 7d to £16 10s. Second quality—2 in. thick, 12 in. to 14 in. wide, £13 8s 1d to £15 9s 4d ; 1¼ and 1½ in. thick, 12 in. to 14 in. wide, £13 1s 3d to £14 8s 9d ; 1 in. thick, 10 in. to 12 in. wide, £12 to £12 14s. Third quality—2-in., 11 in. to 15 in. wide, £9 5s 7d to £11 ; 1, 1¼ and 1½ in., 10 in. to 14 in. wide, £7 11s 3d to £9 12 6d.

Quebec Spruce Deals.—The demand has been good, and prices are firmer. Prices quoted—£6 10s 7d to £7 11s 3d for third quality ; £5 16s 10d to £6 14s per std. for fourth quality.

St. John, N. B., Pine Deals—Are in better request, and prices have advanced. Prices quoted—£6 14s 2d to £9 5s.

St. John Spruce Deals (2nd quality average).—There is a good consumption. Prices are advancing, and are quoted at £6 10s 7d to £8 18s 9d per std.

St. John Birch Logs.—The market keeps firm. Prices quoted—1s 5d to 1s 9d per cubic foot for 15 in. average and up.

St. John Birch Planks.—There is a good demand. Prices—£6 17s 6d to £8 5s per St. Petersburg standard, according to specification.

White Oak Staves.—The market keeps firm, and prices are well maintained. There is a specially good demand for 34 by ⅞ in. and 34 by 1 in., also 42 to 44 by 1 in. Current prices are: Canada butts—5½ ft. by 3 in. thick, £115 to £125 per mille ; 5½ ft. by 2½ in. thick, £90 to £95 per mille ; 5½ ft. by 2 in. thick, £67 to £72 per mille.

(If bent to shape, $2.00 per thousand more.)

would, it seems, result in a very large increase in the annual output. The markets that are opening are not only those countries whose home supply of timber is becoming exhausted, but other countries which have always imported and find their sources of supply being cut off. In addition there are countries, notably the Oriental nations, where the innovation of modern methods has revolutionized conditions and developed, and in some instances created, commerce. This expansion has been felt in all other lines of staple commercial commodities, so that it is not surprising to note that its effect has also been apparent in the timber trade.

Russia, with her trans-Siberian railway and development of seaport facilities and establishment of commerce on the Pacific ; Japan, with her new-found civilization and commercial awakening, are examples of newly created markets, which are immense factors in any commerce. Even China is among the possibilities of trade development. Australia and the other British Colonies are being yearly brought into closer touch with this province, and their requirements include increasing quantities of lumber, shipments of which have increased even in the past year.

The republics that form the greater portion of the South American continent are yearly growing to be reckoned as a commercial factor, and trade with them is increasing and possibilities are great. The foregoing instances will suffice to indicate the vast expansion possible in the export trade in lumber. Nothing has been said of the United Kingdom and Europe, for there the British Columbia product would come into possibly unfair competition with Norway and other European sources of supply. It is quite true past experiences have been largely discouraging, especially in the export branch of the industry, but indications are that some shipments will continue to go forward to Great Britain.

The past year has witnessed a revival of the industry equalling the activity in other lines throughout the industrial world. The changing conditions and extending circle of commerce have, however, produced a situation which it is not too optimistic to expect is a permanent change of base in the timber industry. This being true, there is the possibility that instead of a temporary activity, the timber trade of British Columbia is developing to an extent which it is quite capable of manufacturing should the demand continue. As it becomes known the timber of British Columbia forests cannot fail to become popular, its quality being unsurpassed, combining durability and beauty, when finished, with extreme facility of working. Its size and the straight and even texture of the fibre are recommendations also.

### THE VARIETIES OF TIMBER.

Passing from the general survey of the resources of British Columbia as an economic factor, it is in order to devote a paragraph or two to a particular notice of the different species of wood which are found in the British Columbia forests.

Easily first in point of appearance as well as utility is the great Douglas fir, whose tall, straight boles standing out clear and distinctive as they grow on their native hillsides form an emblem at once striking on account of their individuality and the notion of strength inspired. The Douglas fir, it may be noted, was named after David Douglas, a botanist who explored new California in the first quarter of this century. It is distributed over a wide area from the coast to the summit of the Rocky Mountains and as far east as Calgary, N.W.T., and being found as far north as opposite the northern extremity of Vancouver island on the coast, and even farther in the interior. On the coast it attains the greatest proportions, specimens being sometimes found rising to a height of 300 feet with a circumference of 30 to 50 feet at the base. The ordinary average, is, however, about 150 feet clear of limbs, with diameter of 5 or 6 feet at the base. The characteristic, straight, clear stem, bare of branches almost to the top, makes the tree peculiarly valuable from a lumbering point of view. It is the staple article of lumber in the province, and has a wide range of usefulness, being especially adapted, owing to its great strength, for use in structural work. It is very heavy, being almost of the same specific gravity as oak. Some results of tests of Douglas fir made at McGill University, Montreal, appear on another page.

The next most important species, from an industrial standpoint, is the red cedar, commonly known as British Columbia cedar. It is found all over the province, but it is on the coast that it reaches its greatest development, where it has in some instances attained to such a size as to be placed on the list of show pieces for tourists to visit and admire. Stories are familiar of the comparisons which have been made to illustrate the great girth of these trees—one now stands in Stanley Park, in the hollow of which a horse and rig can stand ; in the early days a real estate man had a photograph taken of a hollow cedar log which he had fitted up as an office. Its chief economic value is for making shingles, being the principal or only material used for their production in British Columbia and for interior finishing, the coloring being rich and of beautifully varied shades, besides being susceptible of taking on a beautiful polish. For this latter it is finding an increasing market in eastern Canada, where it is being used more extensively every year. The shingles manufactured from the cedar are very largely used in Manitoba and the Northwest Territories. Available supplies of good quality of this splendid native wood are unfortunately becoming limited. It is consequently advancing in value very rapidly.

The cypress, or yellow cedar, is a tree which exists in large quantities in the province, but has not been manufactured into lumber to any extent. It is not scattered over so great an area as the red cedar, being found in the interior of Vancouver Island in great quantities and on the mainland near the coast in the northern part of the Province, and also on Queen Charlotte Islands. While it has not yet come into much notice, it forms a valuable reserve in the timber supply of the country. It is a valuable wood, being of great strength and durability, and takes a beautiful finish. It grows to great dimensions.

The white spruce, which is a very useful timber, grows in low swampy lands, and does not occur in large compact bodies, but interspersed among fir and other trees. It almost equals the fir in circumference, but does not grow to such a height nor is its stem so clear of branches. Its range of usefulness is more varied than that of any other of the native woods. It is specially adapted to working up by machinery, so that it is used, as is the cedar, for making doors. Boxes, fruit cases and barrels are also made from the spruce. It is also used to some extent as a finishing wood and is well adapted for it. Perhaps the greatest future for utilization of spruce is in the manufacture of paper pulp, for which it is beyond comparison, the best adapted of all native woods. Some day the vast quantities of this material now going to waste in British Columbia will be turned into pulp. At present the industry is not being exploited, though it will some day be an important one in the province. Further north the quantity of spruce and the proportion compared with other trees increases.

Hemlock is a timber found in considerable quantities up the coast, but being less desirable than fir, will not likely be much used until the latter becomes much scarcer. Balsam, which is of little use except for pulp-making, is found in large quantities, while white pine, yew and tamarack also occur, though in smaller quantities.

Of hardwoods the maple, alder, birch and oak are found, but none of them are found of particular commercial value. The maple and alder occur usually in low bottom lands and their presence indicates great richness of soil. The maple, especially the large leafed variety, is pretty widely scattered. The oak, which is dwarfed and gnarly, and of no value other than as a shade tree, is mainly found in the southern part of Vancouver island. The poplar or cottonwood is a common tree and the only use heretofore made of it is in manufacture of excelsior and in barrel-making. In the future its chief economic value will be in the manufacture of paper pulp, for which it is excellently adapted and the quantities in which it is found render it a very cheap raw material.

### THE TIMBER AREAS.

While the forest covering is pretty well distributed over the province, there are localities which are looked on as the producers of the lumber available for commercial purposes. On both Vancouver island and the mainland the timber limits are located, and they are of very large extent. On Vancouver island the principal timber areas are in the valleys of the Cowichan, Chemainus, Little and Big Qualicum, Campbell, Comox, Nanaimo, Englishman's Salmon, and Adam's rivers, French creek, Black creek and Alberni valley, and along the tributaries of these rivers and other streams ; on the islands of the Gulf of Georgia, namely, Cracow, Harwick, Valdez and others. On the mainland, in Westminster district, the principal locations are on the Fraser, Stave and Pitt rivers, Burrard inlet, Howe sound and in south Vancouver, on the inlets of the coast as far as Knight's inlet. As already mentioned, the timber north of Knight's inlet is mainly yellow cedar or cypress with increasing quantities of spruce, which are timbers that will yet become valuable. In the interior there are merchantable timber areas in east and west Kootenay, the Okanagan valley and the Cariboo district, and on the upper Columbia river.

A feature of the forests of British Columbia, especially of the coast, is their density. As much as 500,000 feet of lumber has been taken

from a single acre, while, by way of comparison, in eastern Canada 20,000 is considered not a bad average.

Reliable figures place the timber area of the province at 285,554 square miles, but this, of course, includes much small timber not suitable for milling.

As the annual forest increase by growth is an element which can hardly be checked up, it is, of course, not possible to compare the annual increment with the annual timber cut and the reduction by destructive fires, and thus form an idea of the net increase or diminution of the available timber resources of the province. The conservation of the forests is a matter of public interest. There is annually a great deal of unnecessary waste by forest fires and in clearing land, the checking of which will become a serious question as the years go by.

The actual available timber supply of the province is in no great danger of serious diminution, as there is to be considered the extremely rapid growth especially in the warm, humid climate of the coast regions. There are, too, large areas of land which, when cleared of timber, are of no value for cultivation and will as a consequence be allowed to return to forest for second growth of timber will soon spring up.

### TIMBER REGULATIONS.

Both the Dominion and provincial governments control areas of timber lands, consequently leases or limits can be obtained from each.

Under the Dominion timber regulations, all licenses to cut timber are disposed of by public competition. Parties tendering are to state the sum per square mile which they will pay over and above ground rent and royalty, certified cheque to accompany tender, and the highest bid being accepted. The length of any berth is not to exceed three times the breadth thereof. The licensee is required to pay a ground rent of $5 per square mile, except for lands situated west of Eagle's Pass in British Columbia, in which case the charge is five cents per acre. Within one month after obtaining a timber berth the licensee is required to pay one year's rental in advance, and if not then paid interest at 6 per cent per annum is charged, the licensee is to pay a royalty of 50 cents per thousand feet on sawn lumber, 1½ cents each on railway ties 8 feet long, and 1¾ cents on ties 9 feet long, 25 cents per cord on shingle bolts, and 5 per cent. on sales of all other products of the berth. The latter is calculated on the average price of lumber for three months previous to payment of dues. The royalty on lumber from burnt timber is 2½ per cent. A rebate of 40 cents per thousand is allowed on all lumber exported from the Dominion. All timber from the berth must be manufactured into lumber at the saw mill of the licensee. Licensees must keep in operation a saw mill capable of cutting 1,000 feet B. M. every 24 hours for every 2½ square miles of area licensed, or establish such other wood manufactory as shall be satisfactory to the minister of the interior.

Right to cut timber on crown lands owned by the province may be obtained in several ways, the simplest being to take out an annual license at the cost of $10, entitling the holder to cut timber as a hand logger upon crown lands after timber limits without reservation as to area. Timber cut under such license is subject to royalties to the crown; special license, valid for one year, may be obtained by payment of $50, entitling holder to cut timber on a specified area not exceeding 1,000 acres, subject to payment of royalties. Timber leases are put up for public competition for periods not exceeding 21 years, and may be granted to the tenderer who offers the highest cash bonus in addition to an annual rental of 15 cents per acre, and the payment of royalties. A rebate of 5 cents per acre may be obtained by erecting a saw mill on or in connection with the leasehold. Royalties payable to the crown are 5 cents per 1,000 feet B.M. on all timber, 50 cents per cord on railway ties and mining props, 50 cents on every 200 running feet of piles, and 25 cents on every cord of wood.

### MANUFACTURE OF LUMBER.

Government statistics of a complete and accurate nature as to the development of the lumber industry and the annual lumber cut only date from 1888, in which year the present Forestry Inspector, Mr. R. J. Skinner, was appointed to the position then newly created by recent legislation. Since that time Inspector Skinner has furnished the Department of Lands and Works with a very complete and accurate report containing in convenient form the lumber cut of the year and other valuable figures. These reports have been from year to year embodied in the annual report of the Chief Commissioner of Lands and Works, and from them the figures given in this article as to the annual output of lumber are largely taken.

According to the Forestry Inspector's returns, the following is the lumber cut for each year since the office was established :

| Year. | Lumber Cut, Feet. |
|---|---|
| 1888 | 31,868,384 |
| 1889 | 43,852,138 |
| 1890 | 79,177,055 |
| 1891 | 83,108,335 |
| 1892 | 64,186,820 |
| 1893 | 60,587,360 |
| 1894 | 64,498,227 |
| 1895 | 112,884,640 |
| 1896 | 112,957,106 |
| 1897 | 105,939,377 |
| 1898 (11 months ending November 30) | 124,546,658 |

A study of these figures will show that the lumber cut of last year was just four times that of ten years ago. A very substantial consideration, however, is that some of the largest mills in the province were not in operation. It will also be observed that for a number of years the lumber cut had suffered a considerable diminution, though the past three or four years have shown a steady and satisfactory growth, due to improvement in both export and domestic trade. This year the lumber cut will be very much larger than for any year in the history of the lumber trade in the province, as almost every mill is in operation and many of them are working day and night.

The area of timber lands, held under lease from the crown, or from which lumber was cut under royalty, is over 1,200 square miles, which is but a small portion of the 285,544 square miles of timber lands in the province.

### THE MARKETS.

As referred to in the beginning of this article, the market for the product of British Columbia saw mills is found in the prairie provinces and territories of Canada, east of the Rocky Mountains, in the countries of Asia bordering on the Pacific Ocean, in Australia and in South America, while European shipments have been made, though that cannot be said to be a regular factor of the export lumber trade of the province as yet.

Australia is at present one of the largest customers, and that trade is but now beginning to expand. This is largely due to direct effort, the head of one of the large lumber concerns having paid a visit to Australia last year and established a representative there, with satisfactory results already. Such efforts, if extended and aided by the government, which annually draws large revenues from the industry, would yield handsomely in the extension of the foreign export trade.

The total export of 1899, though light for the first six months of the year, gives excellent promise of increase, as the Hastings saw mill has been rebuilt on a much larger scale, and the Barnet mills, idle for a number of years, are again being operated, while other enterprises in the lumber industry are on the tapis.

The domestic export trade of lumber to Manitoba and the Northwest Territories, which is practically the only market outside of British Columbia other than by sea, gave a grand total of nearly 24,000,000 feet in 1897, and in 1898 the total was 18,752,730 feet. This trade, which is rapidly growing, is a very satisfactory feature in the market for British Columbia lumber, inasmuch as the great area of country comprised must look to this province more and more each year for its timber supplies, so limited are its own areas of timber and so nearly exhausted are the nearby sources from which it has drawn in the past. Taking this, with the great increase of population on the Canadian prairies and the prosperous years which have been inducing immigration, and the lumber trade of that country will be seen to be a factor capable of enormous increment in the next few years, when the population will no doubt have more than doubled.

The growing consumption of lumber within the province of British Columbia must not be forgotten, as the rapid building up of towns and cities everywhere and the starting of new towns by successful mining camps, has created an unprecedented demand for lumber for home consumption. By reference to the forestry inspector's figures of lumber cut in the province and comparison with the domestic and foreign export, it will be seen that the home market was a customer in 1897 to the extent of some 35,000,000 feet, and in 1898 of 75,000,000 feet. This home demand has been an aid to improving business very materially, furnishing as it has, in the course of using that large quantity of lumber, employment to a large number of men, and the employment has been practically permanent.

### OTHER MATUFACTURES.

The principle manufacture, other than lumber from timber, is at present that of shingles, which are altogether made from the red cedar. Almost the whole supply of shingles for Manitoba and the North-west Territories is drawn from this country, and together with the home demand the total production yearly is very large.

Cooperage works and the manufacture of excelsior are also to a small extent factors in using the timber product of the province. Some day the making of paper pulp will utilize large quantities of what is now largely waste timber in this province and the possibilities in the establishment of that industry should be very attractive to capital seeking paying investment.

The requirements of piling for wharves, etc., and timber for mining props are two ways in which large quantities of timber in the rough are used every year. The timber industry is but in its infancy even with all the present means of consumption, and its future is one of great promise for British Columbia.

H. G. Ross.

Vancouver, B.C., Sept. 12th, 1899.

## STRENGTH OF CANADIAN DOUGLAS FIR.

Herewith are given, in part, the results of tests made under the direction of Professor Bovey in the testing laboratory of McGill University, Montreal, to determine the strength of British Columbia Douglas fir. There were tested, in all, twenty-five beams, of which the following particulars and illustrations are given :

Beam I was of good average quality, with annual rings as in Fig. 3. At 45,000 lbs. the beam failed by the tearing apart of the fibres on the tension face.

coast section of British Columbia, and felled in the fall or during the winter. They were free from knots, of good quality, and with the grain running straight from end to end.

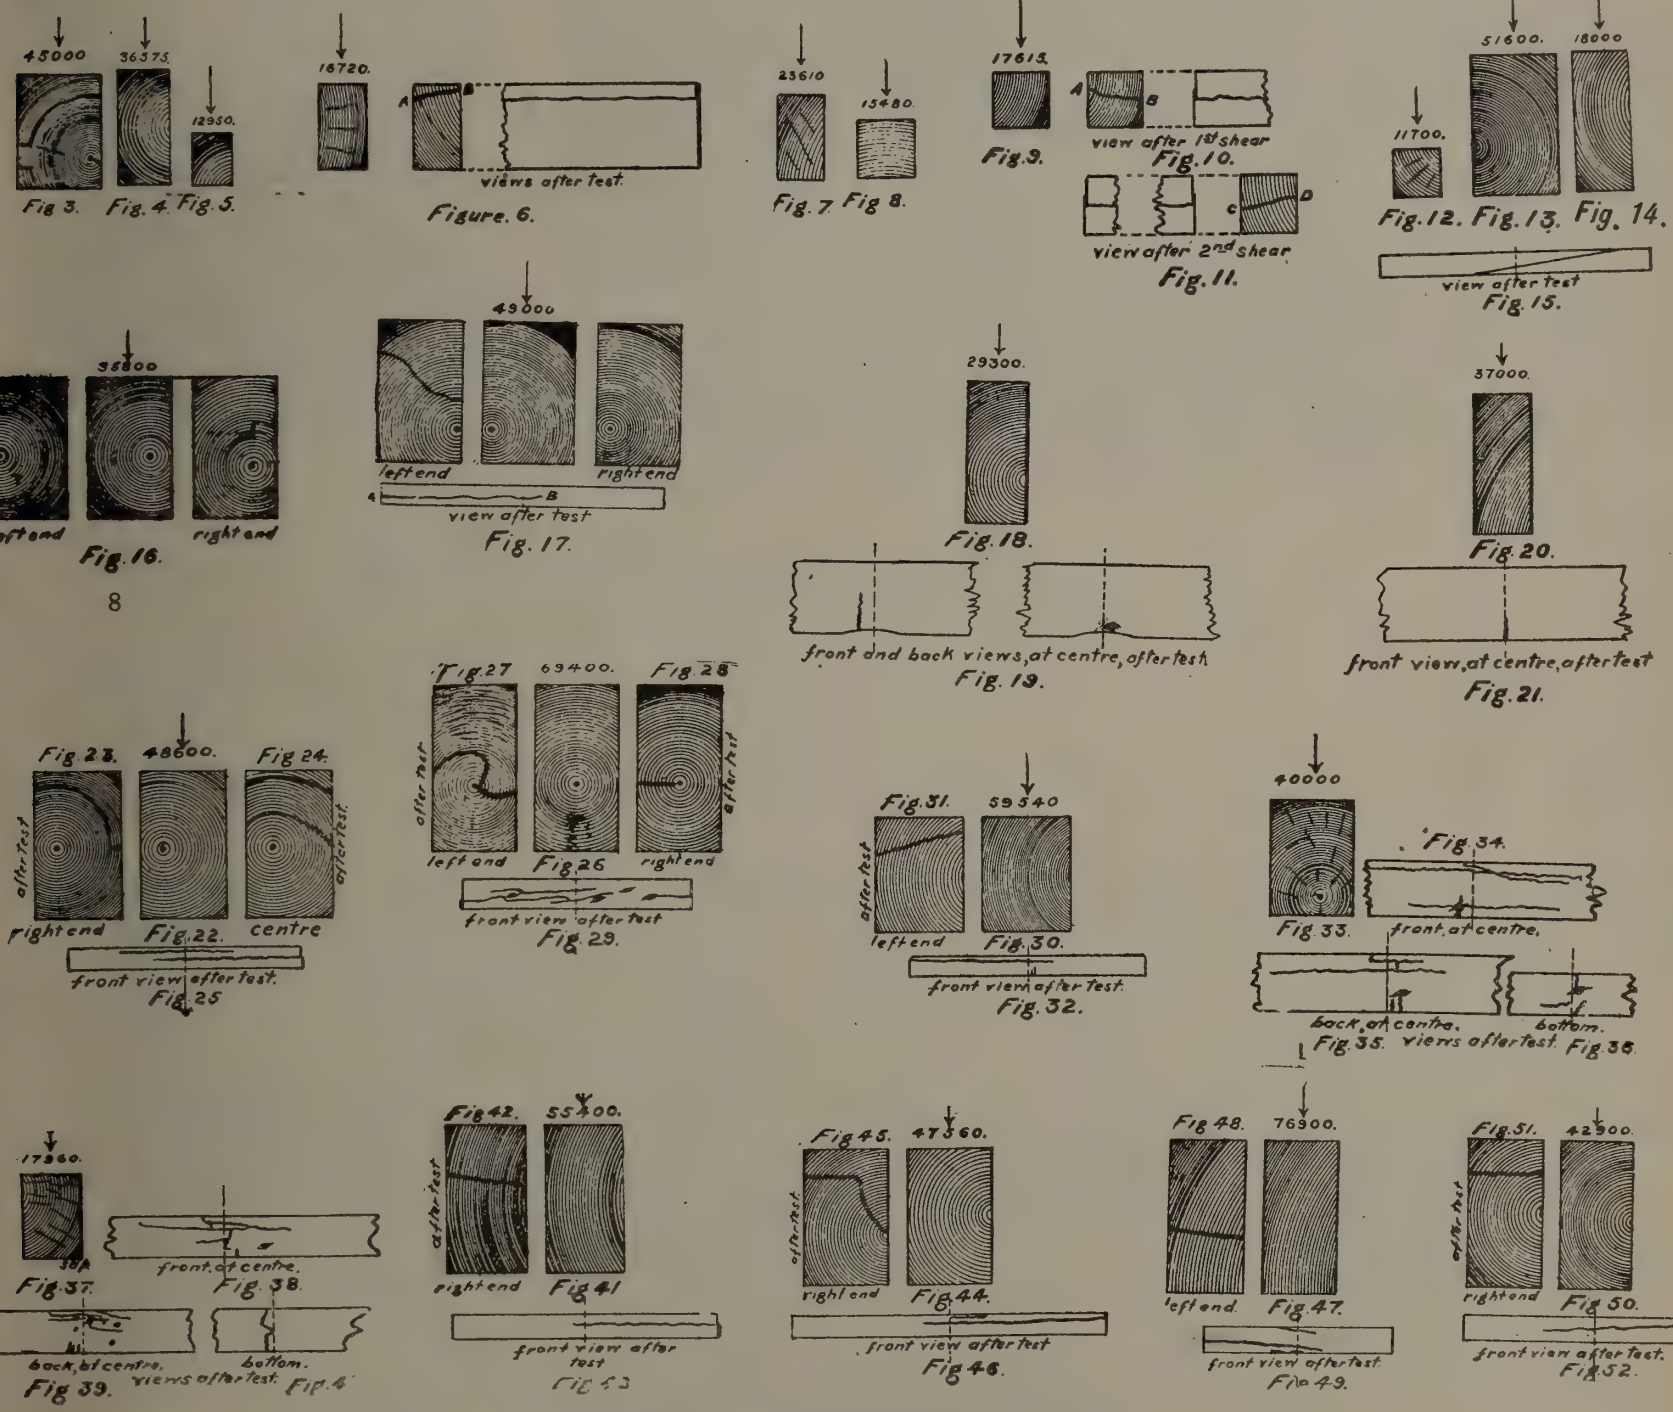
Beam IV showed annual rings somewhat oblique, as in Fig. 6. At 16,720 lbs. it failed by shearing longitudinally along a plane A B at right angles to the annual rings. After the beam had sheared longitudinally the load was again applied until it amounted to 15,000 lbs., when fracture occurred by the tearing apart of the fibres on the tension face.

Beam V showed annual rings as in Fig. 7, shear a load of 8,990 lbs. was applied, when the beam was fractured by the tearing apart of the fibres on the tension face.

In Beam VIII the annual rings were oblique, as in Fig. 12, and at a load of 11,700 lbs. it failed by the tearing apart of the fibres upon the tension face.

Beams IX to XVI were sent to the laboratory by Mr. P. A. Peterson, chief engineer of the Canadian Pacific Railway.

Beam IX was grown on the mainland half way between Vancouver and New Westminster, in a flat country not much above the sea level.



Beam II was of good average quality, with annual rings running as in Fig. 4. At 36,575 lbs. the beam failed by shearing longitudinally. After the fracture the load upon the beam was again gradually increased to 34,000 lbs. before a second failure occurred.

Beam III was of a specially excellent quality, with clear, close, parallel grain, perfectly sound and free from knots, with annual rings as in Fig. 5. At 12,950 lbs. the beam failed by shearing longitudinally.

Beams IV to VIII, sent to the laboratory by the British Columbia Mills, Timber & Trading Company, were cut out of trees grown on the

and failed by the tearing apart of the fibres on the tension face under a load of 23,610 lbs.

Beam VI showed annual rings as in Fig. 8. Under a load of 15,480 lbs. it failed in the same manner as beam V.

Beam VII showed annual rings as in Fig. 9. Under a load of 17,615 lbs. the beam sheared longitudinally along the plane A B, Fig. 10, the distance between the ends of the portions above and below the plane of shear being 3-16 of an inch. The load was again applied until it amounted to 11,840 lbs., when there was a second longitudinal shear along the plane C D at the other end, Fig. 11. After this second

It was cut from a log 26 inches in diameter and 34 feet in length, felled in the month of May. The log lay in fresh water for ten months. It was of first quality, with grain straight and running parallel to the axis. It contained a season crack on the widest face about 11 feet long, 3½ inches below the edge and about 1½ inches deep. Annual rings were as in Fig. 13, the heart of the tree being in one of the vertical faces. Under a load of 51,600 lbs. the beam failed at the support by the tearing apart of the fibres.

Beam X, with annual rings as in Fig. 14, was cut from a log 32 inches in diameter grown on

the mainland 120 miles north and west of Vancouver, on a hillside about 100 feet above the sea level. The log was felled in the winter and remained in salt water six months. The grain in this beam ran crosswise, and it failed by a cross fracture along the plane A B, Fig. 15, under a load of 18,000 lbs.

Beam XI—History same as that of beam X. Timber was of first quality, and grain parallel with axis. The beam contained the heart of the tree, with annual rings as in Fig. 16. Under a load of 35,800 lbs. the beam failed by the tearing apart of the fibres upon the tension face.

Beam XII, with annual rings as in Fig. 17, was cut from the log 28 inches in diameter grown about 30 feet above the sea level about eight miles from Vancouver. Tree was felled in August and remained in salt water nine months, being alternately wet and dry, according to the tide. The timber was of good quality, straight grained, with several knots of medium size and a few season cracks ; beam contained the heart of the tree. Under a load of 49,000 lbs. the beam failed by shearing logitudinally along the season crack A B.

Beam XIII—History same as that of beam IX., with annual rings as Fig. 18. Timber of good quality, several small cracks along the back of the beam, and small season cracks along the whole of the front about three inches above the face in compression. At 29,300 lbs. the beam failed by the crippling of the fibres on the compression face, commencing at a small knot at the back (Fig. 19).

Beam XIV is in reality beam XIII re-tested. The beam was replaced in the machine with the crippled side reverse, so as to be in tension. At 17,600 lbs. it failed on the tension side by the tearing apart of the fibres along the surface at which the crippling took place on the previous test.

Beam XV, with annual rings as in Fig. 20, was timber of first quality, clear and straight grained, and free from knots, its history being same as that of beam XII. At 37,000 lbs. it failed by the crippling of the fibres on the compression face, Fig. 21.

Beam XVI is beam 15 re-tested. The beam being reversed, it failed under a load of 25,580 lbs. at the point at which the crippling had previously taken place. A load of 32,000 lbs. was then applied, when the beam fractured a second time on the tension side.

Beams XVII to XXI were sent to the laboratory by the British Columbia Mills, Timber & Trading Company, and were cut on the coast section of British Columbia.

Beam XVII was coarse grained, contained a number of small knots on the compression side, was cut from the heart of the tree, with annual rings as in Fig. 22. At 48,600 lbs. it failed by the tearing apart of the fibres on the tension face, which was followed immediately by a longitudinal shear coincident with the neutral plane at the centre of the beam and extending for a distance of eight feet from the end, Fig. 25.

Beam XVIII was cross grained, contained several knots, was cut from the heart of the tree, and showed annual rings as in Fig. 26. At 69,400 lbs. the beam failed by shearing longitudinally, the shear being immediately followed by the tearing apart of the fibres on the tension face, Fig. 27, 28, 29.

Beam XIX was of exceptionally good quality, with clear, close grain, no knots, and annual rings nearly vertical, as in Fig. 30. At 59,540 lbs. it failed by longitudinal shearing, followed by the splinting of the upper edges on the tension side, Fig. 31, 32.

Beam XX was cut from the heart of the tree, with annual rings as in Fig. 33, was coarse grained and contained a number of knots. At 40,000 lbs. it failed by the crippling of the fibres on the compression side in the neighborhood of a small knot 1¼ inches above the compression face, Fig. 34, 35, 36. The load was gradually increased to 49,600 lbs., when the beam again failed by tearing apart of the fibres and tension face.

Beam XXI—Annual rings as in Fig. 37. At 17,960 lbs. a sharp fracture took place by the tearing apart of the fibres on the tension side, accompanied by a simultaneous crippling of the fibres upon the compression side, Fig. 38, 39, 40.

OLD DOUGLAS FIR.

Beams XXII-XXV were four old stringers taken from trestles. Beam XXII had been in position for nine years, in a dry country, with very little rain fall, and subject to a hot sun in summer. The annual rings were as shown in Fig. 41. At 55,400 lbs. the beam failed by a longitudinal shear, as in Fig. 42 and 43.

Beam XXIII was taken from a trestle near Port Moody, and had been in position for a period of six and one-half years in a place subject to the heaviest rainfall in the province. Annual rings as in Fig. 44. At 47,560 lbs. the beam failed by the tearing apart of the fibres of the tension face, which was immediately followed by a longitudinal shear, as in Fig. 45 and 46.

Beam XXIV was cut from a log grown on a bench near Spuzzum, about 500 feet above the sea level, and had been in position eleven years in a district with a climate similar to that of Nova Scotia. Annual rings were as shown in Fig. 47, and the beam contained several knots and season cracks. At 41,000 lbs. material at one end of the beam was crushed in. The ends, partially decayed, were sawn off and the load increased to 76,900 lbs., when the beam failed by longitudinal shear.

Beam XXV had been in service on Kamloops Lake for a period of eight years. The annual rings were as in Fig. 50, with heart showing on one of the faces. At 42,900 lbs. a large splinter broke off on the tension face and the beam failed by longitudinal shear, as in Fig. 51 and 52.

The following table gives a summary of the results obtained :

| Beam. | Dimensions in inches. | Weight in lbs. per cubic foot at date of test. | Maximum skin stress in lbs. per sq. in. | Co-efficient of elasticity in lbs. |
|---|---|---|---|---|
| | NEW TIMBER, SPECIALLY SELECTED. | | | |
| | l d b | | | |
| III. | 66 x 5.375 x 4.125 | | 10,441 | 2,178,100 |

## J. A. SAYWARD.

The business of J. A. Sayward was established in 1859 by his father, Mr. W. P. Sayward. The mill is located at Victoria, B. C., on one of the most convenient points of the inner harbor, with a view of catering to local and foreign trade. The saw mill is a two storey building, 220 x 110 feet and is shown in the accompanying illustra-

SAW MILL OF J. A. SAYWARD AT VICTORIA, B. C.

tion. The capacity is 50,000 feet in ten hours. Besides the ordinary product of rough and dressed lumber, laths and shingles are also manufactured.

Mr. Sayward owns extensive timber limits, chiefly of cedar and spruce, which were among the first located on the coast, and therefore containing some very fine timber. He operates

Mr. J. A. Sayward.

logging camps with steam and horse teams, and employs a tug for towing the logs to the mill. A portrait of Mr. Sayward is presented herewith.

## NANAIMO SAW MILL AND SASH AND DOOR FACTORY.

The Nanaimo saw mill and sash and door factory at Nanaimo, B.C., is owned and managed by Mr. Albert Haslam. The mill is a new one just completed, and is situated on Nanaimo harbor, one of the best harbors on the Pacific coast. The main mill building is 220 feet by 50 feet and two stories high. It is equipped with the most improved machinery suitable for the heavy timber of the west. The machinery consists of circular saws, both top and bottom; circular re-saw machine, gang edger, trimmers, planers, conveyers, etc., the capacity being sixty thousand feet per day. The sash and door factory is a two-storey building, 60 × 90 feet. It has a full line of sash and door machinery, as well as lathes, shaper, band saw and all other machines usually found in a well appointed factory. In connection with the mill Mr. Haslam controls over four hundred million feet of standing timber, chiefly fir and cedar. Mr. Haslam has in the past depended to a large extent upon the local market, but erected his new mill now in operation with the intention of engaging in the foreign trade.

## THE BRUNETTE SAW MILL COMPANY.

The plant of the above company is situated at Sapperton, within the corporation limits of the city of New Westminster. These mills have been in successful operation since the early seventies, and have done much to introduce British Columbia timber and lumber into the various foreign markets, where it is now in such large demand. Their principal business, however, is local and Canadian, the rapidly growing provinces of Manitoba, Assiniboia, Alberta and Saskatchewan taking a large share of their output. Ontario and Quebec are also good customers, and even the Maritime provinces find it to their advantage to purchase certain kinds of timber products from this company.

The shipping facilities of the firm are excellent. Lumber carrying vessels of the largest capacity take loads at their docks for foreign ports, and the Canadian Pacific Railway runs through their shipping yard.

Brunette Saw Mill Company—Mills at New Westminster.

The present mill was built in 1895—a fire on the 3rd of July of that year having destroyed their large new mill, in the midst of a very busy season. The capacity of the mill is 100,000 feet per day. Advantage was taken, in rebuilding, to introduce all the most modern improvements, and the mill is now, without doubt, one of the best equipped in the province. The company obtains its chief supply of logs from the islands and mainland coast lying to the east of Vancouver island. The logs are towed in rafts, or booms, of 300 M. to 1000 M. feet B. M., direct from the camps to the mill without breaking bulk. This is found to be a convenient, safe and inexpensive method of

Nanaimo Saw Mill and Sash and Door Factory.

transporting the logs, as the land-locked waters of the Strait of Georgia and the numerous inlets are safe for small craft and for towing. Deep water prevails almost everywhere in these waters, and many snug harbors are to be found for shelter and for holding logs until taken away by the towing steamers.

Three-fourths of the company's cut is Douglas fir, which is the chief wood exported. It is extensively used in Australia and China, for house and ship-building and for mining props. Douglas fir spars are now exported to all the principal ship-building countries; and for decking, this wood is meeting with a great demand. It is also much used in Canada and the United States for car building and for railroad bridges, where great strength is required. It is also rapidly taking the place of pine throughout north-western Canada for house flooring, siding, ceiling, stepping and finish.

Several million feet of white spruce are also cut by this mill yearly. This is chiefly used for box making on the premises, but the clear spruce strips and squares are much in demand for house finish, veranda posts, etc., also for wagon boxes and for oars. This wood would answer admirably for ladders, as it is light and the fibre is very tough.

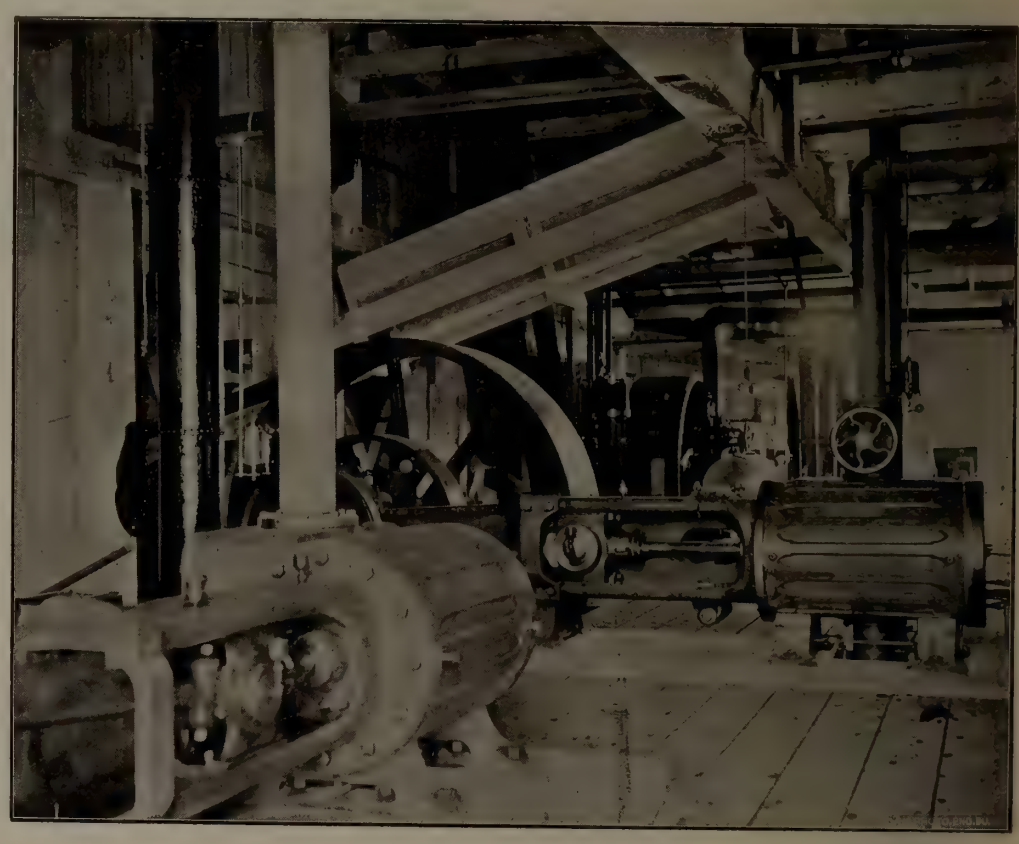
The Brunette Saw Mill Company also hold extensive limits of red cedar, and their trade in this wood is steadily increasing. British Columbia cedar has many good features; it has very little tendency to shrink or swell with the changes in the weather, does not warp, and has an astonishing capacity for resisting decay. It weighs only about 60 per cent. of fir, is easily worked, and is much used in cabinet work, doors, windows, etc. When finished in oil it is very handsome, being of a dark reddish brown. It is by far the most valuable of British Columbia woods, but the shingle mills are making such inroads upon it that the quantity of clear red cedar to be had in a few years will be limited.

Mr. Hugh McDonald, who for a number of years occupied a responsible position in the employ of Mr. J. R. Booth, of Ottawa, is president, and Mr. L. A. Lewis, whose early home was in Dresden, Ont., is general manager of the company. A view of the mill is shown on the previous page.

* * *

## BRITISH COLUMBIA MILLS, TIMBER AND TRADING COMPANY.

This corporation is the largest lumbering concern in the province of British Columbia, owning and operating the Hastings Saw Mill; the Royal City Planing Mills, Vancouver; and the Royal City Planing Mills, New Westminster. The largest of these is the Hastings Saw Mill, admirably situated on the water front of Vancouver city, and of which a view is shown herewith. At this mill the principle export business of the company is carried on, and at its wharves may be seen vessels loading for all quarters of the globe, in all of which the company has customers and business connections.



British Columbia Mills, Timber & Trading Co.—Hastings Mills.

Fig. 1.—"Hamilton Engines."

The old Hastings saw mill built originally in 1865, at which time there was no thought of the city of Vancouver, was destroyed by fire about a year ago, but on the same site has arisen the new Hastings mill, of greater capacity and fitted with more modern machinery than the old one. This has just been completed, and began operations last month. When all the machinery is in operation the mill will have a capacity of 250,000 feet of lumber per day of ten hours, and in addition to the saw mill proper there are extensive dry kilns and a large planing mill, which are busily occupied in turning out all kinds of dressed lumber which is ready dried and prepared to go into any building. The complete equipment of machinery in the mill was supplied by the William Hamilton Manufacturing Company, of Peterboro', Ontario, through their Vancouver agency, and reflects much credit on the company.

Views of some of the machines are shown herewith. Figure 1 is a view of the engine room, which contains the following engines: One pair

of 20″ x 24″ "Hamilton" saw mill engines, coupled; these engines drive all machinery in the back end of the mill, including rolls, transfers, edgers, lath mill and bolter and planers; one engine, 24″ x 30″ driving band mills, and one engine 42″ x 30″ driving large double circulars and log haul-up. All engines are fitted with shaft governors and run 600 feet piston motion, and are capable of developing 2,500 horse power.

Figure 2 shows the "Hamilton" Pacific coast band mill, of which there are three—one band

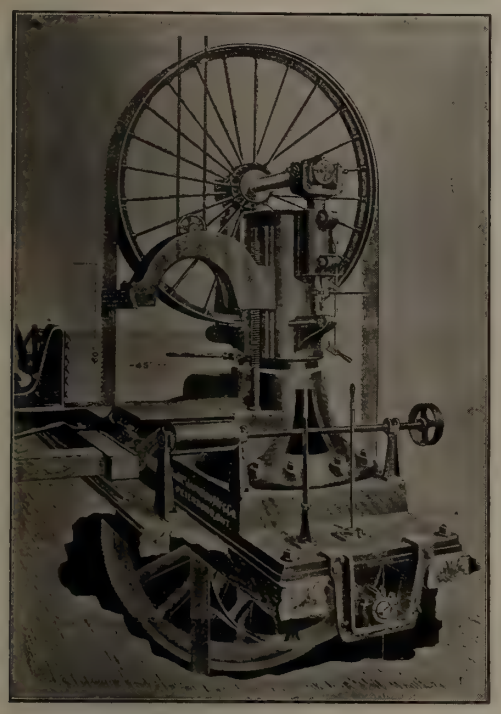


Fig. 2—"Hamilton" Pacific Coast Band Mill.

mill having 9 ft. wheels with 12″ saws; one 8 ft. wheels with 12″ saws, and one 6 ft. wheels with 8″ saws. The latter will be used for re-sawing.

Figure 3 illustrates the Pacific coast gang edger. This is a very heavy machine, capable of sawing cants 60 inches wide and 8 inches thick; it has a variable feed from zero to 500 feet per minute.

Figures 4 and 5 are illustrations of the lath bolter, giving front and back view of same. This machine is a new design, is capable of handling

Fig. 3—"Hamilton" Pacific Coast Gang Edger.

bolts 8″ thick, and is fitted with inserted tooth saws 24 inches in diameter. It is a very heavy machine, and is made extra strong for Pacific coast trade.

Sidings from the main line of the Canadian Pacific Railway traverse the mill yard, and afford the required facilities for the large trade in this style of lumber which the company has with the Northwest territories and the eastern provinces. The shipments by rail, however, are not confined to lumber of such small dimensions, as it is a common thing to see timbers being loaded on cars, the lengths of which require two and sometimes three flat cars to carry them, that is, from 70 to 90 feet, and running in sizes from 12″ to 36″ square.

The excellence of the company's product is so well recognized that orders are received from the remotest eastern points; strange as it may seem, shipments are made to points in the province of Quebec, to Halifax, and even in the face of a hostile tariff to points on the Atlantic seaboard of the United States.

The Royal City Planing Mills, Vancouver, have a sawing capacity of 75,000 feet per day, and a planing mill capacity of 50,000 feet. There is also a large and perfectly appointed sash and door factory in which, in addition to doors and windows, mouldings, mantel pieces, and all kinds of finishing wood-work for interior fittings are turned out, of the most tasteful description. This mill is entirely occupied with local and eastern orders, and also has in operation a shingle mill. The shingles are made of British Columbia cedar and find a ready market as far east as Ontario. At this mill there is also a box factory turning out boxes of all sizes and descriptions.

The Royal City Planing Mills, New Westminster, have also sawing capacity of an equal amount as the Royal City Planing Mills, Vancouver, and is busily engaged in catering to the local and eastern trade, whilst occasionally taking a share in the foreign trade of the company by loading vessels for distant destinations. In connection with the sawing and planing operations, this mill operates a large box factory, having a capacity of 4,000 boxes per day, and supplies the greater portion of the boxes used by the salmon canning industry on the Fraser river.

The company have their own timber limits, and operate their own logging camps, at several of which railways of standard gauge have been put in for the conveyance of logs to the salt water, where they are made up into booms and taken hold of by the company's own tugs and towed to the different mills. In addition to the railway plant for the transportation of the logs, the company have thirteen logging engines employed in hauling the logs to the main roads.

The number of employees is over 1100, whose wages aggregate forty-five thousand dollars ($45,000) per month.

---

Mr. F. A. McMullen, of South Maitland, N.S., purposes making improvements to his saw mill.

Messrs. H. V. Dewar, F. W. Dewar, W. M. Dewar and A. D. Herron, of St. George, N.B., and Daniel Gilmour, of Montreal, are applying for incorporation as John Dewar & Sons, Limited, for the purpose of carrying on the lumber business at St. George, N.B. The capital is $80,000.

## PACIFIC COAST LUMBER COMPANY.

The mills of the above company are located at an advantageous point on the Fraser river at New Westminster, and are designed for manufacturing red cedar lumber and shingles. The parties interested are a few Ontario lumbermen who conducted large lumbering operations for many years in the east, the president being Mr. W. J. Sheppard, who is also president of the Georgian Bay Lumber Co., of Waubaushene, Ont. The manager is Mr. J. G. Scott, of New Westminster, who is also an Ontario man.

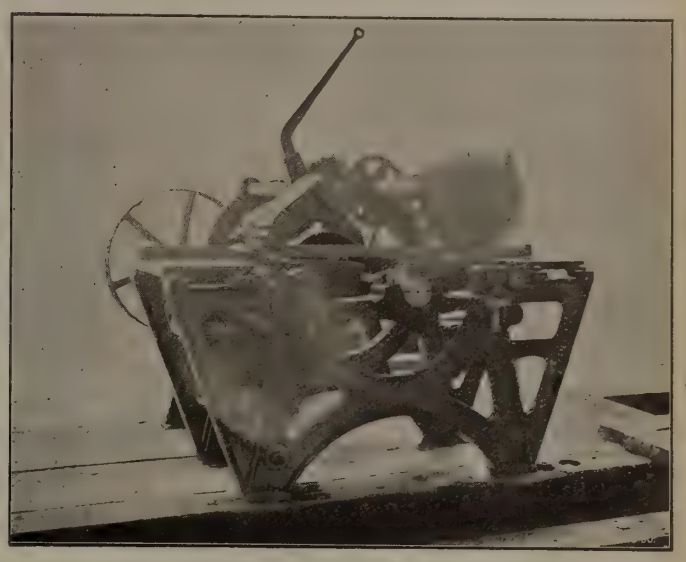

Fig. 4—"Hamilton" Lath Mill, Pacific Coast Pattern—Front View.

Up to the present this company has confined its operations to cedar lumber and shingles, and the business has seemingly outgrown its present well equipped little plant. Although operations are regularly conducted day and night, they are unable to keep pace with orders. This company has been doing a car trade, their markets being principally in Ontario, Manitoba and the Northwest territories, and report a brisk and steadily growing demand. The cedar lumber shipped is usually in manufactured form such as ceiling, siding base, casing, mouldings, door stock, etc., and in Manitoba this firm's "Best Brand" of shingles is said to sell in preference to any other make, as their reputation for evenness of quality is now so well known by the builders and farmers throughout that country. After seeing the care

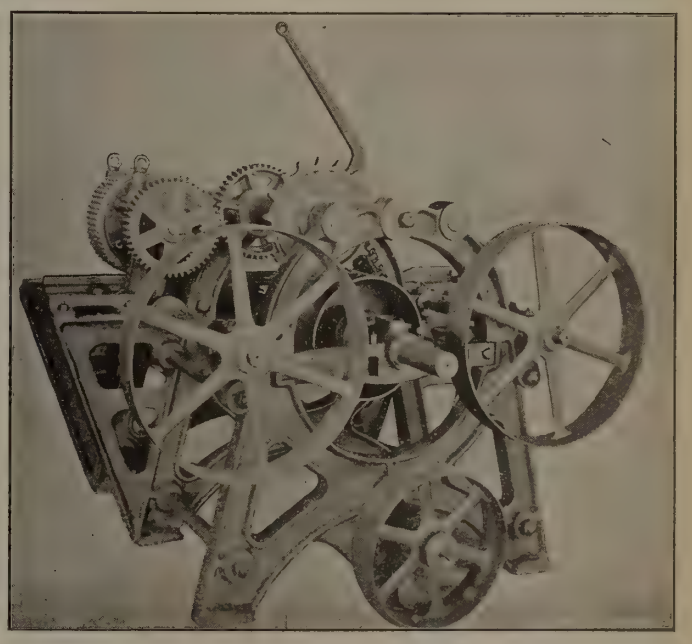

Fig. 5—"Hamilton" Lath Mill—Back View.

bestowed on making, sorting and packing, it can be easily understood that this reputation is well deserved.

Another specialty that this company makes and has the control of is "grained ceiling," the graining being done by a process somewhat similar to lithography. Very natural imitations of the various expensive hardwoods are made, the effect produced being quite equal to the wood imitated. For interior wall and ceiling finish this lumber is finding a good market.

* * *

## OTHER MILLS.

There are within the province several other important saw mills, among which might be mentioned the following: E. H. Heaps & Company, Vancouver; The Victoria Lumber & Manufacturing Company, Chemainus, operating one of the most extensive mills in the province, under the management of Mr. E. J. Palmer; Canadian Pacific Lumber Company, Port Moody; North Pacific Lumber Company, of Vancouver, with mills at Barnet; Geo. Cassidy & Company, Vancouver; Robertson & Hackett, Vancouver; W. L. Tait & Son, Vancouver; Lemon, Gonnason & Company, Victoria; James Leigh & Sons, Victoria; Moodyville Land & Sawmill Company, Vancouver; Ross-McLaren Mills on Fraser river, near New Westminster; G. O. Buchanan, Kootenay Lake; Spicer Shingle Manufacturing Company, Vancouver; Hastings Shingle Manufacturing Company, Hastings; C. P. R. Mill at Coal Creek, on Crows Nest Pass Railway; Fred. Robertson, Revelstoke; Columbia River Lumber Company, of Golden, operating several mills; Taylor Mill Company, Victoria; Burrard Inlet Red Cedar Company, Port Moody; Muirhead & Mann, Victoria; Kootenay Lumber Company, Arrow Lake.

## OBITUARY.

Messrs. Cant & Kemp, timber brokers, of Glasgow, Scotland, announce he death of their Mr. John Chas. Kemp, which took place on September 26th, at his residence, 7 Elmwood Terrace, Jordonhill.

### ARCHIBALD MCNAIR.

IN our last issue reference should have been made to the death of Mr. Archibald McNair, head of the Hastings Shingle Manufacturing Co., of Vancouver, B. C., which took place early in August. For nearly two years Mr. McNair had been suffering from a complication of ailments. He was born in Restigouche County, New Brunswick, in 1838, and was therefore in his 61st year. In his early years he travelled the seas. At 24 he was the captain of his own vessel. Later he abandoned sea life, and bought a flour-mill in Bonaventure, Quebec, where he settled down. Here Mr. McNair also built and operated a sawmill. Subsequently he disposed of both properties, and returned to his native province of New Brunswick. At Nash's Creek he again engaged in the manufacture of lumber. In 1891, with his family, he removed to Vancouver. Since then and up to the time of his death, he had been known and respected as the enterprising owner of the shingle mill at Hastings. His widow, one son and three daughters survive him.

### HENRY BULMER, JR.

EARLY in September a despatch was received in Montreal announcing the death at Fort Selkirk, in the Yukon district, of Mr. Henry Bulmer, jr. Mr. Bulmer, it will be remembered, left Montreal in the spring of 1898 for the Yukon, having accepted the posttion of manager for the Canadian Yukon Lumber Company. The climate there apparently agreed with him, but in April last he was stricken down with an attack of peritonitis. In July a recurrence of the disease set in, to which he succumbed on August 9th. The late Mr. Bulmer was the eldest son of Mr. Henry Bulmer, sr., of Montreal. For a number of years he was engaged as a lumber merchant in that city, where he was a general favorite for his many sterling qualities. He was a member of the Victoria Rifles and afterwards an officer of the Prince of Wales Rifles, in which he served during the Fenian Raid.

### HON. E. J. PRICE.

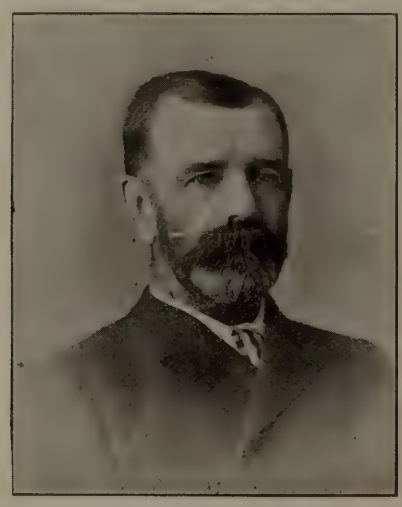
AT Wolfsfield, Quebec city, on August 31st, there died Hon. E. J. Price, Senator for Laurentides division, and head of the extensive lumber firm of Price Bros. & Co. Although deceasad had been in poor health for some time, the intelligence of his death came with much surprise.

It may be said of the late Mr. Price that he was the lumber king of the province of Quebec. He was the fifth son of the late W. Price, who was sent out to Canada about the year 1810 on behalf of the Admiralty contractor, owing to the closing of the Baltic ports against Great Britain by Napoleon I, and erected the first saw mills at Chicoutimi and Tadoussac. After having completed the mission with which he had been entrusted, Mr. Price started in business at Quebec as a timber merchant, under the style of W. Price and Co. On the death of Mr. W. Price, the business was altered to Price, Bros. and Co., under which title it has been known ever since, the partners being the Hon. David Price, son of Mr. William Price, and his brother, the subject of this sketch. Since the death of the former, about fifteen years ago, the Hon. E. J. Price has been sole proprietor. The firm of Price Bros. & Co. are the largest spruce manufacturers in Canada, they having more than a dozen mills in the Saguenay valley and other parts of the province of Quebec. They are also large holders of timber limits in the Saguenay district. For many years Mr. Price had sole control of this enormous business, which has been largely developed by him. Each of the various mills was treated as a separate business, each being under the control of a manager who was responsible to Mr. Price. In addition Mr. Price was largely interested in a factory in Quebec for the manufacture of boxes, shooks, etc. The bulk of the goods manufactured by the firm of Price Bros. & Co. were marketed in Great Britain, although a considerable quantity was shipped each year to South America, the United States, the West Indies, and Australia.

Mr. Price had been in the habit of spending about six months of each year in Great Britain, his agents there being Messrs. Price & Pierce. He was a Senator of the Dominion government, was unmarried, and will be succeeded in business by his nephew, Mr. Wm. Price. He left a valuable estate.

### JAMES TENNANT.

ONE of the best known lumber merchants in Ontario passed away on September 20th, in the person of Mr. James Tennant, head of the lumber firm of James



THE LATE JAMES TENNANT.

Tennant & Co., Toronto, death being due to typhoid fever. Deceased had spent nearly all his life in the lumber business. Born in Princeton, near Paris, Ont., in 1843, he at an early age started farming for himself on the old family homestead. At the age of 27 years he engaged in the lumber business with Sandford, Yale & Co., at Angus, Simcoe County, and remained with that firm for a number of years. Removing to Toronto he became associated with the then well-known firm of Christie, Kerr & Co., being with them for ten years as buyer. In that capacity he became known to almost every saw-mill owner in the province. Upon the failure of the firm of Christie, Kerr & Co., the business was taken over by deceased and his brother Walter, and conducted successfully for some years. Three years ago Walter Tennant died, since which time the business has been conducted entirely by the late James Tennant. The offices in Toronto are located at the foot of Bathurst street. In politics Mr. Tennant was a staunch Liberal, although never taking any active interest in municipal or provincial elections. He was an adherent of the Presbyterian church. In 1868 he married Miss Giles, daughter of the well-known real estate man of Rosedale. Four children survive him.

## "WANTED AND FOR SALE."

Persons having for sale or wishing to purchase a particular lot of lumber, a mill property, timber limits, second hand machinery, etc., in fact, anything pertaining to lumbering operations, will find a buyer or seller, as the case may be, by placing an advertisement in the "Wanted and For Sale Department" of the CANADA LUMBERMAN Weekly Edition. Testimonials to the value of this department by those who have given it a trial state that the results of advertisements were frequently better than anticipated. The cost is comparatively small. Mill owners might, with profit to themselves, make use of this method of advertising their stock to a still greater extent.

"I predict that in ten years' time there will be more people in the Dominion west of the Great Lakes than in the east, and that Winnipeg will contain a population of 100,000 before five years will have passed away." These are the remarks of Mr. J. A. McRae, railway contractor, of Niagara Falls, Ont., who is interested in the Rat Portage Lumber Co. This company, he says, has doubled its output within the past five years, the lumber going exclusively to Manitoba and the North-West. The lumber produced this year by the Rat Portage Lumber Co. and the Keewatin Lumber Co. will reach seventy million feet, the average price of which is about $15 per thousand. Answering a question as to the life of the log supply, Mr. McRae replied that there were logs enough in the Rainy River district to meet the demands of the several mills during the next twenty years. He had just returned from a visit as far west as Winnipeg and Brandon, and stated that he believed the total grain crop of the North-West would come close to 60,000,000 bushels.

* * *

I was privileged to meet in Toronto last month Mr. James Richardson, representing Messrs. Wm. Mallinson & Co., timber importers, of London, England. Mr. Richardson is one of the two partners in this well-known firm, and has visited the American continent periodically during the past eight years for the purpose of buying lumber. In his capacity as buyer, he has also visited nearly all the wood exporting countries in the world, and recently spent several months in India. It was no surprise, therefore, to find him thoroughly posted on trade matters and a most entertaining conversationalist. I learned that his firm import all kinds of timber, selling to builders, railway contractors, ship builders, etc. So far as Canada is concerned, they have confined their purchases chiefly to hardwood, buying in carload lots. They have purchased a considerable quantity of Canadian birch and elm, and while here it was Mr. Richardson's intention to arrange for some shipments of ash. Speaking of hardwoods, Mr. Richardson remarked that they found it possible to obtain Austrian oak at a low price, for the reason that the manufacturers in that country possessed facilities for utilizing every particle of timber. In this way they are enabled to sell their lumber at a moderate cost. This, in his opinion, was the great necessity of the lumber trade of Canada. When prices in Canada reach a certain figure, it becomes impossible to compete in Great Britain with woods from other countries. In this respect Great Britain is peculiarly situated, having the entire continent as well as America from which to draw her supplies. Spruce, for instance, competes with whitewood, and prices can only go so high. Unfortunately, Mr. Richardson says, the quality of American pine is deteriorating. Asked as to the reliability of auction sale prices, Mr. Richardson stated that in the case of mahogany, the greater bulk was sold in that manner, and therefore it was these prices which governed the market; not so with spruce and pine, as stocks offered for sale at auction were usually of a quality too inferior to be included in the regular contract of the manufacturer, or were under-sizes. It is Mr. Richardson's opinion that Canada can secure a larger share of the wood trade of Great Britain, and that she can hold it if her manufacturers fulfill their contracts to the letter, which is something greatly prized by importers.

WE MAKE A SPECIALTY OF CEDAR LUMBER, MOULDINGS, FINISH, ETC.

# THE NEWS.

CANADA.

—Mr. J. D. Shier, of Bracebridge, Ont., has just put in a new log carriage.

—A new shingle mill has been started at Fort William, Ont., by Mr. S. Stevens.

—Mr. F. H. Hale is about to erect a saw mill at Plaster Rock, near Andover, N.B.

—Mr. Ewan Dingwall has made extensive improvements to his saw mill at Williamstown, Ont.

—Messrs. Gillespie & Grier have purchased the planing mill of Argue & Son, at Parry Sound, Ont.

—The match factory of Mr. Dubord at Beauport, Que., was partially destroyed by fire last month.

—The factory of the Ontario Box Co., Hamilton, Ont., which was burned recently, is being rebuilt.

—Mr. Jacob Bingay, of Yarmouth, N.S., is offering for sale his sawmill and timber lands at Hill Grove.

—A new rotary saw mill is being erected at South Maitland, Ont., by L. R. Rettie & Co., of Truro.

—A new saw mill is about to be put in operation at Meech's Lake, Ont., by Messrs. Donnelly & Drum.

—The Canadian Pacific Lumber Co., of Port Moody, B.C., has opened a lumber yard at Vancouver, B.C.

—It is rumored that Reid Bros., of Hepworth, Ont., will probably erect a large saw mill at Southampton.

—An electric light plant has been installed in the saw mill of McLaurin & McLaren, at East Templeton, Que.

—It is stated that Mr. C. McGibbon, of Penetanguishene, Ont., purposes putting a band saw in his mill this winter.

—The saw and planing mill of W. C. Edwards and Co., at Ottawa Ont. was recently damaged by fire to the extent of $7,000.

—Mr. W. Maddock, of Huntsville, Ont., shipped another car load of broom handles to Glasgow, Scotland, a fortnight ago.

—The contract for show cases for the Dominion exhibit at the Paris Exposition has been given to Messrs. W. C. Edwards & Co., of Ottawa.

—The Turner & Fisher Lumber Company have opened an office at Trout Creek, Ont., in order to facilitate the transactions of their business.

—Mr. A. E. Young is building a sash and door factory at Columbia, B. C. He will also manufacture all kinds of mouldings and furnishings.

—Mr. E. Spraggett has built a new sawmill on the main Kettle river, half a mile from Grand Forks, B.C. The capacity is 30,000 feet per day.

—The Chemanius Lumber and Manufacturing Co. have given a free site and the necessary lumber for a general hospital to be built at Chemanius, B.C.

—The North Pacific Lumber Co., of Vancouver, B.C., have purchased a 24 × 30 timber sizer of the Berlin make, said to be the largest machine ever made.

—The exhibits for the Paris Exposition must be in Montreal by November 2nd, in order to be shipped by the Dominion government steamer Stanley.

—Mr. S. Rogers, of Cedarville, Ont., is offering for sale his saw, shingle and chopping mill at that place, together with about 300 acres of timber land.

—Messrs. J. L. Reaume & Co., of Essex, Ont. are manufacturing staves from sycamore. They have added considerably to their holdings of timber lands.

—The Ottawa Saw Works Company have made a proposition to the City Council of Hull, Que., to remove to that city and erect a factory to cost about $30,000.

—In common with all other articles of manufacture, axes have advanced considerably of late. It is said that axes that formerly sold at $4.75 are now quoted at $6 per dozen.

—It is reported that Mr. John A. Christie, formerly manager of the Assiniboine Lumber Co., at Brandon, Man., will remove to Skagway, where he has purchased a saw mill.

—The sawmill of E. G. Thomson & Co., near Cascade, B. C., has been purchased by Mr. D. Bailey, of Columbia. Mr. Bailey has removed the mill to Gilpin's ranch, on Kettle river.

—The Department of Interior at Ottawa invites tenders up to October 9th for a license to cut timber on a berth of 39 square miles on Lobstick Creek, in the district of Alberta, N.W.T.

—The Canadian Office and School Furniture Co., of Preston, Ont., are about to engage in the Australian trade, having arranged with a large wholesale dealer at Brisbane to handle their goods.

—The Parry Sound Lumber Co. are overhauling their saw mill at Parry Sound, Ont., and purpose operating it next year. New tramways will be built. This season their shingle mill only was operated.

—Messrs. John Harrison & Son, of Owen Sound, Ont., are just completing a large extension to their planing mill. Mr. J. S. Findlay, of same place, announces his intention to increase the capacity of his mill.

—Mr. O. Kitely, formerly with the Puget Mill Co. at Port Gamble, Wash. has succeeded to position of superintendent of the Hastings mill at Vancouver. This position was formerly held by Mr. W. D. Mearne.

—Messrs. H. A. Wilder & Co., of Montreal, are interested in securing a site in the eastern townships of Quebec on which to build a large furniture factory. It is necessary that there should be a good supply of hardwood timber.

—The North Pacific Lumber Co., of which Mr. J. M. Portras, formerly of Ottawa, is manager, expect to have their mill at Barnett in operation this month, after having been idle for a few years. It will cut 100,000 feet per day.

—The statement is made that the Capital Box Co., of Tacoma, Wash., will erect a box factory at New Westminster, B.C., costing about $40,000 and employing 75 hands. This company have lately been shipping a considerable quantity of their goods into British Columbia.

—A barque has loaded box shooks at St. John, N.B. for Glasgow. This is the first full cargo of shooks ever sent from that port, it being supplied by Donald Fraser & Sons, of Fredericton. This firm have just completed a new mill at Lake Temiscouata, near the headwaters of the St. John.

—A lumber camp near Chatham, N.B., owned by Hon. J. B. Snowball, was burned recently. It contained peavies and other lumbering tools, besides a large quantity of camp supplies. There were six buildings in the group, all but the one, containing the sleds and rigging, having been burned.

—A number of lumbermen, including Messrs. James Playfair, Geo. Chew, and D. L. White, jr., and W. J. Shepard, W. H. F. Russell, and W. J. Lovering, of the township of Tay, are seeking incorporation as the Midland Power Co., Midland, Ont., for the purpose of supplying light, heat and power.

—The mill of the Digby Manufacturing Co. at Digby, N.S. which was burned last month, contained a rotary, a complete equipment of planing and moulding machinery, and a printing press for stamping wood. Although the loss is only partially covered by insurance, it is understood to be Mr. Wood's intention to rebuild.

—On the evening of September 17th burglars entered the office of McArthur & Son, lumber merchants, South Lancaster, Ont., blew open the safe and secured promissory notes to the amount of $15,000. As yet no clue as to the parties has been obtained, but the firm are offering a reward for the return of the stolen notes.

—Mr. Thomas Southworth, chief of the Forestry Department of Ontario, draws attention to the increasing use of wood for street paving purposes in England. He does not see any reason why some of the coarser varieties of Ontario woods cannot be used in connection with street paving. For example, the jack pine of Ontario, he thinks, is far superior to the Baltic or Norway timber, being a heavier, stronger and denser wood. Mr. Southworth is of opinion that it would be an excellent thing to test the durability of jack pine as street paving material by laying a quantity of it on some Toronto thoroughfare as an experiment.

—The E. B. Eddy Co., of Hull, Que., are building new kilns for the drying of lumber used in the manufacture of tubs, pails, matches, etc. The wood will be treated by hot air driven through the kilns through flames and supplied by a system of steam fans. The arrangement will be such that the hottest air will act on the wood containing the most moisture. When the wood is partly seasoned it will be placed higher up in the kiln where the remaining moisture will be driven out, while the fibre and color of the wood under treatment will not be affected. The kilns will be of two styles, vertical and horizontal, and will cost in the neighborhood of $15,000.

—The employees of McLachlan Bros., sawmillers, Arnprior, Ont., were given a free excursion to the Ottawa Fair, the firm providing them with free transportation, street car tickets and admission to the Fair grounds. The employees and their families numbered 1,275, and were carried by sixteen coaches. The outing was given on account of the success which McLachlan Bros. have met with in their operations and as an acknowledgement of the part played by the employees, who fully appreciated the kindness. McLachlan Bros. operate four mills, two steam and two water power. Their annual cut is about 15,000,000 feet and the yards cover an area of 200 acres.

FOREIGN.

The United States Department of Agriculture is preparing for the Paris Exposition a history of forestry in that country, including an account of the efforts of private land owners to apply the principle of forestry. The work is in charge of M. Gifford Pinchot.

—An effort is being made to organize a company for establishing a modern sawmill on the American plan at Wahu, China. It is said that Li Hung Chang has signified his willingness to take stock to the extent of $2,000. In the Celestial empire there are no up-to-date sawmills.

—The Swan-Donogh Lumber Co., of North Tonawanda, N.Y., have recently acquired the planing mill and box factory of Calkins & Co., and are using it in connection with their lumber business. The purchase includes one of the largest planing mills in the Tonawandas, a box factory and the real estate on which both are located, a dry kiln, four shaving presses, lime kiln with stock, 225 trucks, about 2,000,000 feet of lumber, yards and docks, two lighters, two lumber sheds and two offices. The planing mill is splendidly equipped, and Canadian dealers shipping lumber across the line to be dressed at the border may find it to their advantage to avail themselves of the facilities possessed by the Swan-Donogh Company for handling this trade.

—During the fiscal year ending June 30, the United States exported the following timber products, compared with year preceding: Sawn timber, 416,448,000 feet, against 338,575,000; hewn timber, 4,796,658 cubic feet, against 5,489,714; logs and other timber, in value, $3,262,589, against $3,189,820; boards, deals and plank, 973,064,000 feet, against 790,659,000; joists and scantling, 34,394,000 feet, against 35,610,000; shingles, 73,734,000, against 50,524,000; staves, 44,325,545, against 54,142,759; all other lumber, in value, $3,081,295, against $3,256,880. The total value of the exports of wood and manufactures thereof for the year amounted to $41,679,416, against $37,513,252 in 1896 and $39,624,800 in 1897. The total exports of lumber for the year from the United States was, in round numbers, $1,904,391,000 feet.

## CASUALTIES.

—F. Gagnon, a lad of fifteen years, was killed in Gilmour & Hughson's mill at Hull by being caught in the shafting.

—F. Capp, of Ottawa, while working in the woods on Black River, for W. C. Edwards & Co., had his left leg broken by a falling tree.

—Wm. McCollum, a well-known logger, was crushed to death by a log while getting out timber at Dower Point, B.C., for Tait's mill at Vancouver.

—Harry Dooley, a mill hand at J. R. Booth's mill at Ottawa, was caught between two rolls and drawn in front of a large circular saw, being mangled in such a manner that he died shortly afterwards.

—While loading cars at McLaurin & McLaren's mill at East Templeton, Que., Joseph Bertrand was crushed between one of the cars and a pile of lumber which fell against him. His nose, collar bone and jaw bone were broken and other injuries sustained.

—Angus McDonald was employed at the slab saw in J. D. Carew's saw mill at Lindsay. Accidentally he fell against the saw, which cut almost half way through the left leg below the knee. As he endeavored to regain his footing the saw caught his left hip and sheared off a large portion of his leg. McDonald will recover.

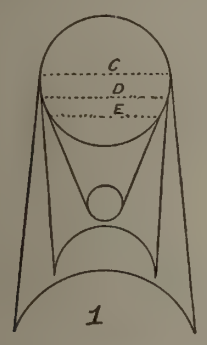
—As a three inch deal was being edged in Gillies Bros' saw mill at Braeside, Ont., it stuck in the saw. An employee, Chas. Reid, endeavoured to overcome the difficulty by moving the adjustable saw, but just as this was done a piece of edging flew back and struck him over the heart, resulting in his death in a few minutes.

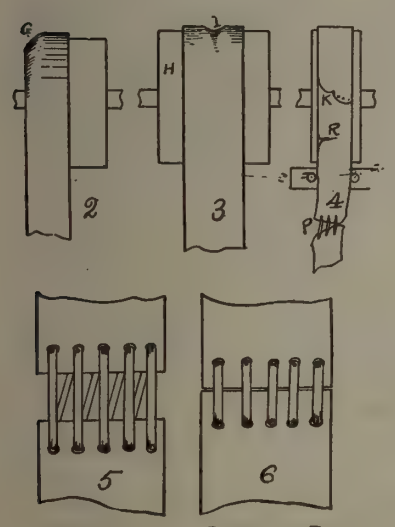
## LUBRICATION OF LEATHER BELTS.

The consumption of oils and greases for the lubrication of leather belts is much larger than many suppose. There are, of course, a number of special belting compounds which are used for the dressing of leather belts; but most of the manufacturing plants and power consumers adhere to the old way of caring for the belts, which consists in cleaning them at intervals with grease and oil, tallow or the like, then allowing the belts to stand until the lubricants have been absorbed. Belts which are run in dye houses, bleacheries, steam laundries and places where the air is moist do not get dry enough to require lubrication. But belting in wood working, metal working, shoe manufacturing, flour and similar establishments is more or less subjected to the dry, dust-laden atmosphere of the rooms, and in time becomes harsh, dry and stiff.

A little oil, grease or similar substance may be used to advantage in restoring the pliability of the leather. The trouble is that some men use too much of the lubricant. If the oil or grease is flowed all over belt and is not given time to impregnate the fibre, the belt will lose its grip on the pulley, and quickly run off. If, however, the softening stuffs are uniformly and lightly applied and given time to saturate the leather, the fiber will gradually assume a softer and more pliable condition, which will improve the driving qualities of the belt and avoid slipping.

But it is not always lack of a lubricant that causes a belt to slip and run to one side. If a belt is so arranged





Lubrication of Leather Belts.

as to take in but a portion of the pulley, like C, Fig. 1, then much of the arc of contact is lost and the belt will slip with a load, even if the leather is properly lubricated. If the arc of contact is increased to that of D, a fuller grip is obtained of the contacting surfaces, and the belt will not be so likely to slip if it is properly limbered up with the right lubricants. If the arc of contact is brought to F, the bite is still more increased, and the danger of slipping averted, other conditions being right.

The most effectively lubricated leather belts will run to one side if the wheels are incorrectly set. This is illustrated in Fig. 2, in which a sample is given for the condition in which the writer finds very many pulleys. For some reason the local machinists are quick to decide that the belt itself, the lubricants, or anything but the pulley itself, is wrong. The tendency for a belt is to run to the high side of a pulley, except in case where the belt pulls down on the pulley, as in Fig. 2, when the belt rides the lowest edge at G. There is but one remedy, and that is to line up the shafting on which the pulley runs. Then the belt will take the centre of the wheel.

In Fig. 3 is a common case. A tight and loose pulley run together, and the belt shifter is adjusted so that but a fraction of the belt runs on the tight pulley. The result is that the belt constantly slips. Lubrication will not help it. Procure a monkey wrench and set over the belt shifter so that the full width of the belt will run on the tight pulley, and the difficulty will be overcome. Or if the tight and loose pulleys are set so as to permit a space to exist between, the belt will sink down as at I, and, of course, produce slippage.

If the tendency is for the belt to take a side of the wheel, Fig. 4, out of line with the guide pins J of the shifter, much trouble will result. The strain coming on that side of the belt, the edge will be broken as at R and K, and probably the joint opened as at P. The remedy again is to level up the shaft and pulley.

Again, it may happen that a correctly adjusted belt and freely lubricated one slips at certain points. Then examine the splices. If the jointing of the belt is open, like that in Fig. 5, it may be seen that the slipping occurs here when the lace leather is riding the wheels. The only remedy is to draw up the lacings and close the butts of the belt, as in Fig. 6.—American Miller.

## QUESTIONS ON STEAM ENGINE OPERATION.

A writer in Modern Machinery asks the following questions: 1. How shall I proceed in order to equalize the load on the two pistons of my compound engine, 16 and 30 inches in diameter respectively? At present the high pressure piston does much more work than the low pressure and I wish to remedy the evil. 2. What is meant by re-evaporation in the cylinder of a steam engine? 3. Is it a source of gain or loss in economy? 4. How can it be prevented? The answers given are as follows: 1. If you have an adjustable cut-off on your low pressure valve gear, shorten up the point of cut-off. This will increase the back pressure on the high-pressure piston, and raise the initial pressure on the low pressure, thus giving more expansion and a better distribution of the steam. If you have no cut-off on the low pressure valve-gear, or if it is not adjustable and you cannot have it made so, lower your boiler pressure and carefully note the effect. This will raise the terminal pressure in the high pressure cylinder, and send more steam to the low pressure? 2. There is always more or less water in the cylinder when running, either from a boiler that furnishes wet steam, from a steam pipe that is not well protected, or on account of initial condensation. After the cut-off has taken place the pressure falls rapidly, and if it is very low near the end of the stroke it so reduces the boiling point that the heat in the walls of the cylinder causes it to evaporate into steam again, but too late to be of any service? 3. It is a source of loss, because it takes heat from the cylinder without producing steam in time to be of value. The result is that when another charge is admitted, some of it is condensed, and this loss frequently is heavy, although often unsuspected by engineers. 4. Measures should be taken to furnish the cylinder with dry steam, it should be well lagged to prevent condensation, and as the pressure cannot fall too low unless the load is light and the cut-off short accordingly, the boiler pressure should be reduced until the terminal pressure is raised. If this is not practical on account of the necessity of maintaining a high pressure for other purposes, a reducing valve may be placed in the steam pipe. These changes will also increase the economy by reducing the loss from other sources.

## ENGINEERING NOTES.

Water Hammer.—If steam be admitted at the top of a vessel partially filled with cold water, condensation will take place until the surface is somewhat heated, and this, in connection with a cloud which forms above the surface, will retard rapid condensation, so that in due time the full steam pressure can be maintained above water cold at the bottom. This phenomenon is not an infrequent occurrence in boilers in which the circulation is defective. It is therefore perfectly safe to heat up any vessels containing cold water, if the steam can be admitted from the top upon the surface of the water and so maintained.

Oil Testing.—A home-made oil tester for a shop consists of a shaft and balls with a shell between. The whole rests in half bearings, around which is put an iron strap, the tension being regulated by a set-bolt. The balls run in grooves. To test, apply the oil, run the shaft and if the bearing gives signs, upon cooling, that the lubricating oil is gumming, it is an indication that resins of similar body-giving substance have been used. Resin oil, if properly distilled, does not produce this clogging. These bearings form pretty good oil testers, and then are sometimes found where they will generate heat with one oil and not with another. Such a bearing will determine the special merits of a machine oil.

The temperature of water in a boiler is the same as the temperature of the steam. Water cannot be heated higher than 212 degrees in the open air because it evaporates at that point; but in a closed vessel such as a boiler where there is pressure this tends to retard the boiling and the temperature of the water is always the same as that of steam.

Belting.—The ultimate strength of ordinary bark-tanned single leather belting varies from 3000 to 5000 pounds per square inch of cross section. The thickness of single belting varies from 3/16 inch to 5/16 inch, and from 3/8 to 5/8 inch for double belting, and by taking the mean thickness we get the breaking stresses from 750 to 1250 pounds per inch of width for single belts and 1500 to 2500 pounds for double belts. The safe working tension should never exceed one-fifth of the strength of the joint, which is about one-third the above values. From this we find that by taking 1/5 of 1/3 of the breaking stress, or 1/15, the working tensions are, for single belting, 50 to 80 pounds, and for double belting, 100 to 160 pounds. Belts will run with the minimum of attention for many years, if the tensions do not exceed 50 pounds for single and 80 pounds for double belts per inch of width.—From "Smokeless Heat," by General Engineering Company.

When cold water comes in contact with hot plates, it cools them very rapidly and unevenly, the result being that the cooled part of the plate shrinks much faster than the rest, and this either cracks the plate or weakens it so much as to make it unsafe. The boiler may or may not explode, depending on the amount of injury done to the plate, and the steam pressure. A boiler explodes for the reason that some part is too weak for the pressure. The weakness may be due to a variety of causes, such as poor material, design, or workmanship, or to injury while in use. There is probably no case in which an explosion is due to gases generated in the boiler, although that theory is held by some. If the inside of the boiler is coated with scale, so as to prevent the heat from passing readily to the water, the plates may be cooler than the water if they are exposed to the air, or hotter if exposed to the fire; otherwise there will be very little difference in the temperatures.

# WOOD PULP DEPARTMENT

## PULP MANUFACTURE IN BRITISH COLUMBIA.

It is a subject of wonder that no pulp mill has as yet been established in British Columbia. In that province there is to be found an abundant supply of spruce timber, somewhat similar to the spruce of eastern Canada which has become so widely known for its excellent pulp-producing qualities. While no pulp has been mannfactured in British Columbia, shipments of this material have been made to Japan from Sault Ste. Marie, Ont., via Vancouver and other Pacific coast ports, and it is believed that a large trade will eventually be opened up with Japan, China and Australia. We are pleased to learn that an English syndicate is now considering the development of this trade, and that it is possible that calcium carbide will also be manufactured. The field seems to be a promising one.

## WOODS FOR PULP MAKING.

With the expansion of the pulp industry, experiments are being made with a view to finding suitable woods other than spruce for pulp making. While we do not anticipate that spruce will be superseded by any other wood, the fact cannot be overlooked that the steps taken towards finding other suitable woods have met with some degree of success.

Much attention has been paid to cottonwood, which is now used quite extensively for pulp making in Missouri, Arkansas, Tennessee and other parts of the United States. It is said that cottonwood is even better adapted for the manufacture of pulp for making the higher grades of paper than is spruce.

Hemlock is steadily coming to the front as a pulp wood. The Central Paper Co. are about to establish a pulp mill at Muskegon, Mich., the raw material for which will be hemlock slabs and edgings exclusively. This will be the first exclusive hemlock pulp mill in the United States. The raw material will be gathered up at the hemlock mills in the Muskegon district and brought by rail to that point, where a special patented process will be used for converting the wood into pulp. Other mills in Michigan and Wisconsin use hemlock as part of the raw material, one at Menominee using about 16,000 cords annually.

In connection with yellow pine, some experiments of much interest have taken place. A method is said to have been discovered by which the pitch can be extracted from long-leaf yellow pine so that the almost inexhaustible supply of that timber may be turned to the paper makers' use. A practical test of the method has been made, and a mill is being erected at Pensacola, Florida.

Perhaps the most important discovery has been that flax straw may be used for pulp making purposes, the product thus manufactured being superior, it is said, to that made from the best pulp woods. According to report, the Lloyds, of London, Eng., purpose establishing a mill at Niagara Falls, N.Y., with the intention of using flax straw as the raw material.

B. Mooney & Sons, of St. John, N.B., have taken the contract of building the new pulp mill of the Cushing Sulphite Fibre Co., near that city. The contract for boilers has been awarded to James Fleming & Son, of St. John. Work on the building has been commenced, and it is hoped to have the plant in operation by next spring.

It is rumored that Mr. Haggin, of New York, and his associates, have inspected water powers on the Great Northern Railway in Quebec, and that it is the intention to form a company for the manufacture of pulp and calcium carbide on an extensive sale. It is further stated that Mr. Haggin has lately sold large copper mines in the west for a considerable sum.

## HISTORY OF PULP AND PAPER MAKING.

Though paper made from vegetable products was in use many centuries before the Christian era; it is barely a hundred years since an adequate machine for making paper on an extensive scale was devised. The name of the inventor is forgotten; and though his ingenious device has been exploited, and his earliest machine altered and improved by daring plagiarists, there are comparatively few to whom the name of Louis Robert is familiar. Yet it was he who laid the foundation of an industry that has now swelled to gigantic proportions, and has contributed largely to the civilization of the world.

Louis Robert was a young clerk engaged in Francois Didot's paper-mill in Paris, France. Though not a trained mechanic, his tastes lay in the direction of mechanical contrivances, and he was struck by the circumstance that, while improvements in machinery were being introduced in nearly every other industry, paper-making was being conducted on the antiquated lines that had been followed for centuries. The process was tedious and uncertain, for if the workman who took the pulp from the vat on to the mould had not a steady hand, the paper was sure to be of unequal thickness. Robert's first purpose was to abolish the human moulder, and to substitute an adjustable machine which could be easily regulated. Having drawn out the plans of his proposed machine, he consulted with Didot, and ultimately the working out of Robert's idea was committed to the charge of the famous machinist, Foudrinier, by whom the first paper machine of this kind was constructed. In 1798 Didot had one of these machines working in his paper-mill. The unsettled state of France at that time prevented the development of industry; and in an evil moment Robert was induced to join with Foudrinier in a project for introducing the new machine into England. Ground was acquired in Hertfordshire, and in 1804 an extensive paper-mill was built there. This venture proved a complete failure, terminating in bankruptcy. Fordrinier returned to France, where he devoted himself to making paper machines for German and English manufacturers. The fate of Robert has not been recorded. It is certain that he never received the fortune to which he was entitled for his invention.

The principal changes in the making of paper have had reference to the adoption of substances for the manufacture of pulp, rather than to the manipulation of the pulp after it was formed. And here it may be mentioned as a curious fact that the modern idea of using wood for pulp-making is merely a revival of the oldest method of making paper known in history. It is stated that twenty-five centuries ago the Chinese used vegetable pulp for making paper, taking the down of the cotton plant as the chief ingredient. A similar method was followed in Japan, and seems to have made its way into India and Persia at a very early date. It has been proved beyond dispute that some of the ancient Egyptian

manuscripts were written upon paper made from a vegetable paste, entirely different in composition from papyrus, which was the inner bark of the cyperaceous shrub called papyrus antiquorum.

The use of rags for the making of pulp dates from the close of the fourteenth century. The first mill for the manufacture of paper of this kind was established at Nuremburg in 1390 ; and shortly after that date similar mills were erected at Essonnes and Troyes. The rags used in Germany were chiefly linen, thus retaining the old idea of vegetable pulp ; but in France, and afterwards in England, woollen rags were preferred. The principal French mills were in Auvergne and Normandy. When the Edict of Nantes was evoked, many of the workmen engaged in these mills fled to England and Holland, and thus it happened that when the Elzevir Press was in existence, paper was provided of a kind not before known in the Low Countries. A century before that time (in 1588) a German, jeweller to Queen Elizabeth, founded the first paper-mill in England, at Deptford ; but the French and Dutch paper was preferred to the native manufacture, and was largely imported.

In the time of Cardinal Mazarin's supremacy (1641-1664), an attempt was made to revert to the old vegetable paper, a peculiar transparent paper being devised for the purpose of teaching children to write and draw from printed examples. The plan was not successful, nor was the similar effort in 1770 to reintroduce paper made from cotton pulp. When the Marquis de Villettee, the friend of Voltaire, published his works in 1786, he caused them to be printed on paper made from the marsh-mallow ; and at the end of his book he gave specimen pages of different kinds of paper made from twenty other substances. Louis Robert, the inventor of the paper machine, re-discovered in 1796 the secret of the Elzevir paper, and produced successful examples of it at Didot's mill at Essonnes. In 1802 the Dutch paper-maker Koops brought out his famous "straw-paper," though he had been anticipated by the Marquis de Villette twenty years before. In 1840 M. Julien proposed that Chinese bamboo should be used in making pulp, and though some of the manufacturers took up the idea, it was found to be too expensive ; and the attempt to substitute rose-fibres proved unsuccessful. Modern paper-makers use a great variety of substances for making pulp. The most notable change in recent times is the use of wood-pulp for paper-making. Nearly all the daily newspapers are printed on paper of this description, and the method is vaunted as a brilliant modern discovery. And yet it is only a revival and modification of the plan pursued in China hundreds of years before the birth of Christ.—Commercial Gazette.

## PULP NOTES.

The capital stock of the Laurentide Pulp Co., Grand Mere, Que., has been increased to $1,600,000.

The Blind River Lumber Co. are offering for sale a valuable water power on the Blind river in Algoma, which is said to be a very desirable site for a pulp mill.

It is stated to be the intention of the International Paper Co. to enlarge their wood preparing mill at Three Rivers, Que., by installing from 20 to 25 barkers, and by remodelling the plant generally. This property was formerly owned by the Glen Falls Paper Co.

The largest cargo of wood pulp ever landed in England arrived there recently on the steamer Hatasu, from Quebec. It consisted of 37,700 bales, of a total weight of 4,712 tons.

Mr. C. W. Morrison, of Brooklyn, N.Y., spent some time in Ottawa last month negotiating with Gilmour & Hughson for the purchase of 3,000 miles of spruce limits situated on the Gatineau river. He inspected the water powers at Ironsides and Chelsea, it being the announced intention of the company which he represents to build a pulp mill in Canada with a capacity of over 300 tons per day.

The Riordan Pulp Co. have put in operation their new pulp mill at Hawkesbury, Ont. This mill will manufacture pulp for the finest book paper, principally for the United States. The mill of the above company at Merritton will continue to make pulp for news and other cheap paper. Three digestors for the Hawkesbury mill were manufactured by the Polson Iron Works, Toronto, and three were purchased in Detroit.

The International Paper Company is gradually extending its foreign business, having recently established a Japanese branch. Mr. Shizuo Kando, who six years ago was the first to introduce American paper direct into Japan, has been selected as manager. He will make Tokyo his headquarters, and will establish a branch office at Osaka. These two cities, about 1,000 miles apart, are to Japan what New York and Chicago are to the United States.

As we go to press $500,000 of stock in the Sissiboo Pulp & Paper Co. is being offered to the public. The prospectus of the company gives the details of its proposed operations, which are to be carried on at Sissiboo Falls, near Weymouth, N.S. An established plant is to be taken over, together with 17,000 acres of land, well timbered with spruce. The company has also acquired the only available wharf property on the Sissiboo river at Weymouth Bridge. The directors of the company include some of Montreal's prominent business men, and no difficulty is likely to be experienced in disposing of the stock.

### FLAX STRAW AS PULP MATERIAL.

The Paper Mill is authority for the statement that English capital will be interested in a proposed pulp mill to be built at Niagara Falls, N. Y. It is said that the Lloyd's Limited, Insurance and Financial brokers, and Mr. Harold Krall, London, Eng., will be important factors in the new project. From what can be learned the mills play an important part in the revenue of western farmers, inasmuch as the straw of the flax is the raw material to be used in this new pulp mill.

Concerning the use of this material one contemporary says: "Heretofore it is understood to have been the custom of the growers of flax to cut off the top of the growth in order to obtain the head and seed for oil and other purposes. In many instances it has been a practice, it is said, to either burn the straw or plow it under, the growers not finding a market for this part of their product. It was this plentiful supply that led to experiments being made, with the result that a process has been discovered whereby this straw, heretofore practically useless, will be turned into pulp, and this pulp, those who know state, will be of fine quality. The men interested have been through the West and have made a full and careful examination of the situation in regard to the amount of raw material possible to obtain and the probable cost of the same, and they are delighted with the outlook. This raw material, the flax straw, will be baled out west in a dry state. The cars will be loaded to their utmost capacity, and it will be shipped to the mill at Niagara Falls. In shipping it in a dry state the consignee will not have freight to pay on green or water-soaked goods, and thus an item of considerable expense is avoided. To dry the flax straw, is to study economy in the same manner that the wood now brought from Canada is barked before shipment. On arrival at Niagara the straw will be fed to the machines in the proposed mill. The process to be used is understood to be similar to the manner in which wood is now treated in the digesters of a sulphite mill. The fibre is said to be remarkably strong, and it is understood that the product of the mill will be shipped to eastern manufacturers of high-grade book paper. One Niagara Falls paper maker stated that he had it intimated to him that the promoters of the new company already had a very desirable market open to them for their product. It is further stated that the pulp made from flax straw will make even a stronger sheet of paper than rags, while it is much nicer in color and can be made much cheaper. To-day many mills are running and using bleached sulphite in book paper, and it is understood that the new flax straw pulp will replace this material in many of these mills."

A report states that Mr. J. C. Morgan, who represented the International Paper Co. in England, has been engaged as manager of the new concern.

**POSITION WANTED**

A Competent Accountant, with large practical experience in the Lumber and Saw Mill business, desires to form connection for further work, or would undertake charge of Accounts and Bookkeeping together with official correspondence and orders. TRADE DICK'S ORIGINAL BALATA GUTTA PERCHA & CANVAS BELTING MARK

# OCTOBER, 1899

AN average size **"LEFFEL"** or **"VULCAN" Turbine,** working under a 20 foot head of water, is as good as a 100 h.p. Steam Plant, and can be bought for about ONE-TENTH the price.

Such a Turbine may be run constantly for 20 years—some have been used for 25 years. In 20 years the cost of maintaining the Steam Plant would probably reach $40,000—a tidy sum to "lay by" if you have the water power. NOTE—You can't save it all, or be sure of much of it, unless you equip with **"LEFFEL"** or **"VULCAN."**

. . . . . .

Large and costly Band and Gang Saw Outfits have their uses, but 95% of the Saw Millers of Canada are much more interested in a good Circular. That fact accounts for many hundreds of **"LANE IMPROVED"** Mills doing high duty in all corners of the Dominion.

. . . . . .

When open for the above Specialties or anything in the way of **Shingle Machines, Pulleys, Shafting, Gears, Bearings, Etc.,** you are invited to correspond and address

## This Saw Stands Without a Rival

AND IS THE

**FASTEST CUTTING SAW IN THE WORLD!**

Its Superiority consists in its Excellent Temper. It is made of "Razor Steel," which is the finest ever used in the manufacture of Saws. We have the sole control of this steel. It is tempered by our secret process, which process gives a keener cutting edge and a toughness to the steel which no other process can approach.

## Maple Leaf Saw Set

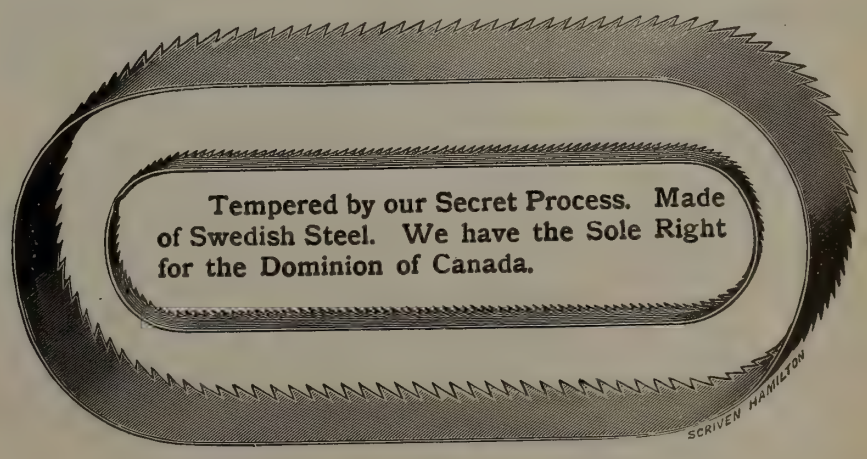
MANUFACTURED BY

**SHURLY & DIETRICH, Galt, Ont.**

**Directions.**—Place the set on the point of tooth, as shown in the accompanying cut, and strike a very light blow with a tack hammer. If you require more set, file the tooth with more bevel.

If you follow directions you cannot make a mistake. Be sure and not strike too hard a blow, and it will set the hardest saw. **On receipt of 40 cents we will send one by mail.**

We are the only manufacturers in the world who export Saws in large quantities to the United States.



We Manufacture

# HIGH GRADE BAND SAWS

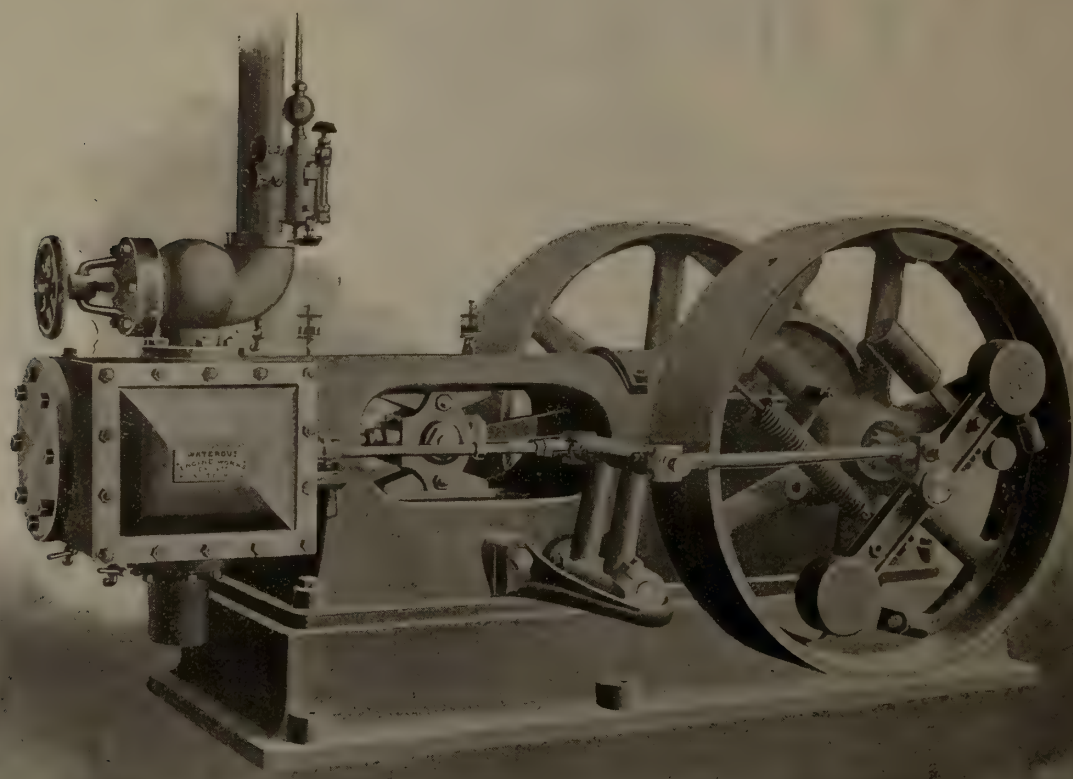
of All Widths and Lengths.

These Saws are made of Refined Swedish Steel imported direct, and tempered by our Secret Process; for Fine Finish and Temper are not excelled.

# The McEwen Automatic Engine

BUILT IN CANADA BY

## THE WATEROUS ENGINE WORKS CO., BRANTFORD



**Perfect Balance**—photographs of 50 h.p. placed on rollers, not held down by bolts or otherwise, running at full speed, show Engine clear cut and still except in reciprocating parts.

**Ample Weight**—to take all the thrust and stroke of engine, ensuring cool and noiseless movement.

**Simplicity of Construction**—and ease of access—a slide valve anyone can understand and adjust—crosshead easily adjusted.

**Shaft**—a double crank, forged and slotted from the solid bar—properly counterbalanced with crank pin same size as bearing—a perfect construction—running cool, noiseless, giving no trouble.

**Regulation**—Here's our guarantee :

**GUARANTEE:**

"The engine shall not run one revolution slower when fully loaded than when running empty, and a reduction of boiler pressure from the greatest to that necessary to do the work will not reduce the speed of engine one revolution. Any engine failing to meet this guarantee becomes the property of the purchaser upon payment of one dollar."

**Price**—a fair one considering quality, weight and merit.

These Engines are running most satisfactorily—driving saw mills, wood-working, electric and other plants in Canada.

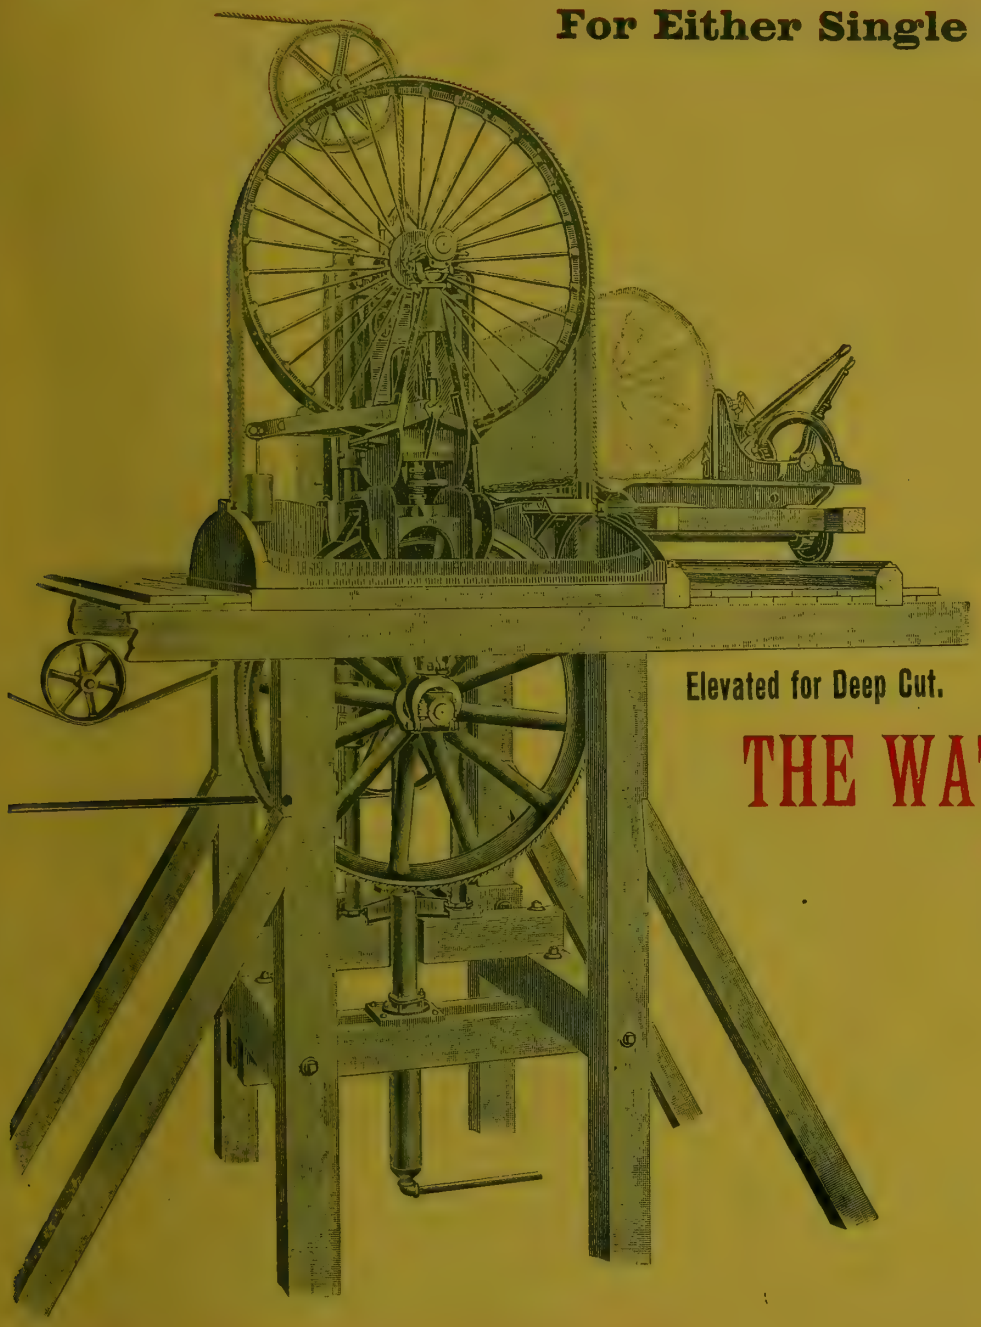
# New Allis Telescopic Band Mill

## For Either Single or Double Toothed Saws



Elevated for Deep Cut.

Is built on correct mechanical principles.

This entire mill is moved vertically, so that the centre of the upper band wheel can be brought down close to the top of the smallest log, thereby having a saw shorter than a gang saw above the work on any sized log, thus doing away with upper guide.

The vertical movement keeps the surplus length of saw blade below instead of above the log. The upper wheel acting as the guide, insures the greatest possible rigidity of the saw, enabling the saw to stand more feed than on the ordinary band mill.

**Manufactured in Canada only by**

## THE WATEROUS ENGINE WORKS CO.

**BRANTFORD, CANADA**

Lowered for Narrow 12″ Cut.

## As a Double Cutting Mill

**No Offset**—carriage travels at uniform speed each way, saving rack and strain.

**Safer**—each side of saw cuts its own clearance.

**Smoother** lumber; teeth not cutting almost plane the lumber in passing.

**Saws**—last longer, require less work to keep in order—strain being equal on both edges.

**Increased Cut**—30 to 50% with practically no additional cost.

Adjustment to depth of cut quicker than operating the old guide.

J. D. Shier, Bracebridge, Ont., has run this mill as a double cutter night and day all season, and verifies the above statements. He is more than pleased, says no one can afford to cut lumber with any other mill.

The Rat Portage Lumber Co., Norman, Ont., have run it as a single cutter all season, and are especially well pleased.

PLEASE NOTE.—Our capacity is limited—even with increased facilities and very much larger force—we have been and are running to our utmost capacity. Prices are advancing in sympathy with the large and steady increase in raw materials.

To obtain earliest delivery—probably then later than desired—orders should be placed at once. Some recognizing this have already ordered Telescopic Bands for next year's work.

PETERBOROUGH, ONT.

# R. H. SMITH CO., LIMITED

## St. Catharines, Ont.

We are the Sole Manufacturers of Saws under the

## Simonds' Process

in the Dominion of Canada.

There is no process its equal for tempering circular saws. Other makers recognize this fact, as some of them, in order to sell their goods, claim to have the same process. **All such Claims are FALSE,** as the patentee in the U. S. and ourselves are the only firms in the world who use it.

MILL STREAM, QUE., on I. C. R'y, December 17th, 1894.

R. H. SMITH CO., LTD., St. Catharines, Ont.

DEAR SIRS,—Driving a 20 in. 13 gauge saw into frozen hardwood, using a 9 in. 4-ply belt, if it can be done satisfactorily, is a very severe test. Your saws have stood that test better than any I have tried. I have been experimenting with different makes—both home and imported—during the last five years, and give yours the preference. Last order is just to hand and will report on them by and bye.

Yours very truly, JAMES McKINLAY.

CAMPBELLTON, N.B., Nov. 17th, 1894.

R. H. SMITH CO., LTD., St. Catharines, Ont.

DEAR SIRS,—In regard to your Shingle Saws, you can say that I have been using Shingle Saws of your make (Simonds) for the past four years, and they have given good satisfaction. I am running nine machines and use a good many saws, but have never had a saw yet that did not work satisfactorily. Before using your saws I used saws of American make, which worked well, but after giving your saw a trial have continued to use yours, as they are cheaper, and in regard to working qualities are all that is needed.

Yours truly, KILGOUR SHIVES.

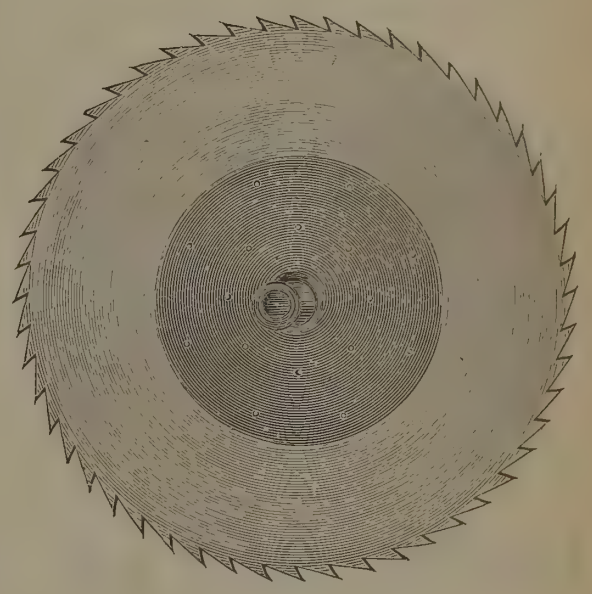
CLAVERING, ONT., May 3rd, 1897.

R. H. SMITH CO., LTD., St. Catharines, Ont.

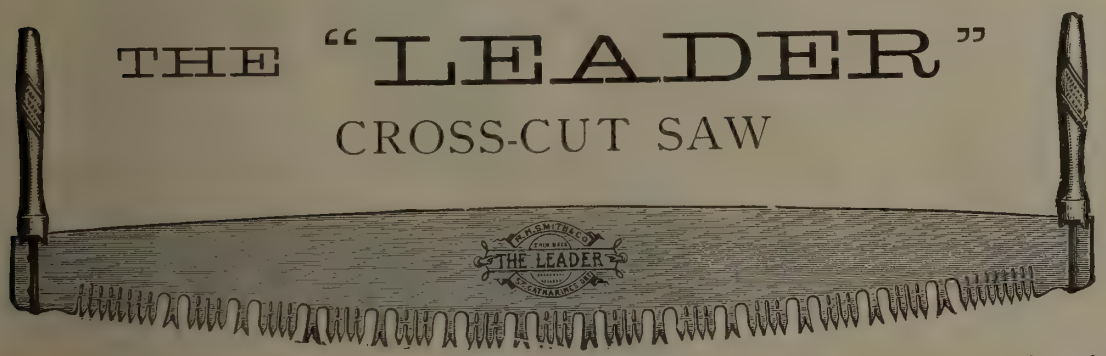
GENTS,—In reply to your letter asking me how I liked the 62" SIMONDS Saw, I must say in all my experience I never had a saw stand up to its work like the one purchased from you last month. Having used saws for the last 22 years, and tried different makes, I can fully say it is the best saw I have ever had in my mill, and would recommend the SIMONDS' Process Saws to all mill men in need of circular saws.

Yours truly, W. G. SIMMIE.

P.S.—I am sending you my old saw to be repaired; please hammer to same speed as new one. W.G.S.



## THE "LEADER" CROSS-CUT SAW



These Saws are made from the best DOUBLE REFINED SILVER STEEL, warranted four gauges thinner on back than front, and the only Saws on the market that are a perfect taper from the points of the teeth to the back, and require less Set than any other Cross-Cut Saw.

They are tempered by the Simonds' Patent Process, insuring a perfectly uniform temper throughout the plate, and stand without a rival as the BEST, FASTEST, AND EASIEST-CUTTING SAW KNOWN. A gauge to regulate the clearing teeth is furnished with each saw.

Directions for Setting and Filing are plainly Etched on every Saw. None genuine without our Registered Trade Mark as shown in cut.

## THE "LEADER" SAW SWAGE

**Made in 3 Sizes—$2.00, $2.50, $3 00 Net.**

## HON. E. J. DAVIS,

COMMISSIONER OF CROWN LANDS FOR ONTARIO.

IN the reconstruction of the Ontario Cabinet consequent upon the retirement of Hon. A. S. Hardy, Hon. J. M. Gibson, who for four years has had charge of the Crown Lands Department, becomes Attorney-General, and is succeeded as Commissioner of Crown Lands by Hon. E. J. Davis, late Provincial Secretary. The placing of the crown lands of the province under the supervision of Mr. Davis will, we believe, prove to have been a wise course, and one which will give general satisfaction. Readers of THE LUMBERMAN will be interested in the following brief sketch of his career.

Hon. E. J. Davis, M.P.P. for North York, is of United Empire loyalist descent, his father, Ashel Davis, having come from one of the Carolinos in 1770 and settled in Halton county. Mr. Davis himself was born in the township of King on December 2nd, 1851, and was educated at the public schools, at Waterdown grammar school, and at Hamilton Commercial College. When seventeen years of age he was apprenticed to learn the trade of tanning, an avocation which he has since followed with marked success. He is to-day at the head of the firm of A. Davis & Son, of King City, one of the largest tanning establishments in Canada.

From his boyhood Mr. Davis has always taken a keen interest in the public affairs of the country. He has served in the capacity of councillor for King township, and as deputy reeve, reeve and warden for the county of York. He was the youngest man ever elected to the council board of King township, and the youngest warden York county has ever had. In the year 1888 he was elected a member of the local house at a bye-election to fill a vacancy caused by the resignation of Dr. Widdifield, and was re-elected with large majorities in 1890, 1894 and 1898. He took an active interest in the work of the legislature, and showed himself a man of much capacity. His incisive and logical style of debate, lighted up with a kindly humor and graceful oratory, and his extensive and accurate acquaintance with public affairs, commanded the esteem and admiration of all the members of the legislature. He soon became a member of the important committees of the House. He was acting chairman of the Public Accounts Committee during the session of 1894, and was next session elected chairman and president over its deliberations. On the reorganization of the cabinet, caused by the retirement of Sir Oliver Mowat and the accession of Mr. Hardy to the premiership, Mr. Davis accepted a cabinet position without portfolio, and on the demise of Hon. Mr. Balfour he became provincial secretary, assuming charge of that department on August 28th, 1898. This position he has since occupied, in which capacity he has exhibited an intimate and thorough knowledge of the accounts of the province.

Mr. Davis began his career as a public speaker by debating the temperance question, a cause in which he has never lost interest. He is a total abstainer, and has been a member of the Sons of Temperance since 1870. He is a member of the Independent Order of Foresters and of the Masons; in the latter order he is P.M. of Robertson Lodge No. 292. He is a prominent member of the Methodist church, and has been a teacher of the Bible class in the church at King City for 23 years. He is also a member of the Toronto Board of Trade and of the Commercial Travellers' Association. In 1874 Mr. Davis was married to

HON. E. J. DAVIS.

a daughter of Squire David Johnston, a Justice of the Peace at Aurora.

The industrial, commercial and business experiences of Mr. Davis well fit him to discharge the duties pertaining to the honorable and responsible position of commissioner of the crown lands of Ontario, and the lumbermen of the province may feel assured that at his hands their interests will receive due consideration.

## COCKBURN VS. IMPERIAL LUMBER COMPANY.

AN important judgment was delivered last week by the Supreme Court at Ottawa in the action of Cockburn v. The Imperial Lumber Company. The judgment deals with the rights of lumbermen under the Provincial Statute known as the Saw Logs Driving Act. The facts which gave rise to the litigation were briefly as follows: The plaintiffs, Cockburn & Sons, of Sturgeon Falls, owned timber limits on Deer Creek, in Nipissing District, and the Imperial Lumber Company had limits on the other bank of the creek. Both parties were entitled to the use of the stream. In June, 1896, Cockburn & Sons complained that their logs in the creek had been detained during the driving season by jams of the Imperial Lumber Company's logs which were ahead. Proceedings were instituted under the Saw Logs Driving Act and the matters in dispute were referred to the arbitration of District Judge Valin, of North Bay. The arbitrator in August, 1896, awarded $1,376 damages to Cockburn & Sons, and it subsequently appeared that this amount was made up as follows: (1) $1,276 for damage suffered by Cockburn & Sons by reason of the company having obstructed the stream ahead of the former's logs, and (2) $100 for seizure and detention by the company of some of Cockburn & Sons' logs under a claim of lien thereon for expenses which the company claimed to have incurred in breaking jams further up the stream.

The Imperial Lumber Company claimed that the award was invalid upon the ground that the arbitrator had no power under the Saw Logs Act to award damages for obstruction of the stream, and that the only remedy when a person's logs are obstructed by another person's logs is to break the jam and claim a lien for the cost of doing so.

The action to enforce the award was tried before Mr. Justice Rose at the Barrie assizes in November, 1897. Judgment was given in favor of Cockburn & Sons, holding that damages may be recovered under the act for wrongful obstruction of waters to which the act applies.

From this judgment an appeal was taken to the Court of Appeal, and in January, 1899, that court, composed of Chief Justice Burton and Justices Osler, Maclennan, and Lister gave judgment reversing that of Mr. Justice Rose, and holding that the Saw Logs Act gives no right to an owner of logs to recover damages from a person who allows his logs to form a jam and so obstruct the stream.

The Supreme Court, composed of Chief Justice Strong and Justices Gwynne, Taschereau, King and Girouard, have now reversed the judgment of the Court of Appeal and restored the judgment of the trial judge.

The practical result of the decision is that an owner of logs who is wrongfully obstructed in the use of a stream is not confined to the remedy of removing the obstruction and then recovering the expense of doing so, but he may claim damages for the delay.

Dunn & Boultbee, now of the firm of Denton, Dunn & Boultbee, have acted as solicitors for Cockburn & Sons, Mr. H. D. Gamble being associated with them as counsel. Barwick, Aylesworth & Wright have represented the Imperial Lumber Company.

The M. L. Russell property at Renfrew, Ont., has been purchased by A. H. Hough, who intends rebuilding the saw mill.

## IMPORTS AND EXPORTS OF TIMBER PRODUCTS.

THE Statistical Year Book of Canada for 1898, compiled by Mr. Geo. Johnson, Dominion Statistican, and issued by the Department of Agriculture, has reached our desk. The book, as usual, is very complete and bears evidence of the great amount of attention bestowed upon the various subjects by its author. The tables published should be of interest and value to the business community of Canada. From the book we take the following statistics of the imports and exports of wood goods:

### IMPORTS OF FOREST PRODUCTS—FREE GOOD.

| | 1897. Value | 1898. Value. |
|---|---|---|
| Corkwood | $ 12,106 | $ 39,367 |
| Barks, cordwood | 66,372 | 55,945 |
| Barks, other | 1,018 | 2,501 |
| Felloes of hickory wood, rough, sawn to shape only | 29,600 | 23,438 |
| Hickory spokes rough turned | 60,366 | 10,906 |
| Ivory nuts (vegetable) | 9,458 | 19 793 |
| Fence posts and railroad ties | 92,409 | 68,236 |
| Logs and round unmanufactured timber, N. E. S. | 139,577 | 136,918 |
| Lumber and timber— | | |
| Cherry, chestnut, gumwood, hickory and whitewood | 156,883 | 227,280 |
| Mahogany | 15,566 | 42,492 |
| Oak | 339,540 | 484,782 |
| Pitch pine | 162,906 | 295,748 |
| Redwood | 1,229 | 190 |
| Spanish cedar | 15,596 | 9 228 |
| Walnut | 44,550 | 56,049 |
| Timber, squared or sided | 357,132 | 4[illegible]2,363 |
| Sawed boards, planks deals and other lumber | 331,937 | 384,767 |
| Shingles | 39,9 0 | 19,772 |
| Staves | 25,245 | 27,440 |
| Wood for fuel | 28,405 | 21,861 |
| Other articles of the forest | 52,798 | 138,433 |
| Total | $2,032,554 | $2,527,509 |

### EXPORTS OF FOREST PRODUCTS.

| | 1897. | 1898. |
|---|---|---|
| Ashes, pot, pearl, leached and other | $ 101,590 | $ 112,305 |
| Bark, for tanning | 112,154 | 105,057 |
| Basswood | 41,636 | 37,044 |
| Hickory | 1,718 | 437 |
| Firewood | 173,921 | 140,897 |
| Knees and futtocks | 8,972 | 14,175 |
| Logs, cedar, for shingle bolts | 4,280 | 500 |
| Logs, elm | 77,978 | 5 ,784 |
| Logs, hemlock | 13,790 | 4,030 |
| Logs, oak | 4,066 | 2,517 |
| Logs, pine | 1,832,352 | 1,6 6,671 |
| Logs, spruce | 102,399 | 38,885 |
| Logs, all other | 90,843 | 89,430 |
| Lumber— | | |
| Battens | 24,594 | 20,350 |
| Deals, pine | 3,266,087 | 3,814,947 |
| Deals, spruce and other | 7,394,485 | 7,918,366 |
| Deal ends | 637,193 | 641,043 |
| Laths | 471,341 | 343,378 |
| Palings | 8,403 | 14,851 |
| Pickets | 35,532 | 18,052 |
| Planks and boards | 10,817,912 | 5,611,537 |
| Joists | 23,531 | 5,2 9 |
| Scantling | 414,443 | 241,044 |
| Staves | 699,381 | 401,083 |
| Other lumber | 315,660 | 243,672 |
| Total lumber | $23,808,562 | $19,273,552 |
| Masts and spars | $ 2,926 | $ 2,448 |
| Piling | 72,850 | 135,154 |
| Poles, hop, hoop, telegraph and other | 61,232 | 36,126 |
| Posts, cedar, tamarac and other | 54,537 | 23,374 |
| Shingles | 1,201,360 | 994,3 6 |
| Sleepers and railroad ties | 229,780 | 1 1,19 |
| Stave bolts | 3 ,[illegible]34 | 20,811 |
| Shooks, box | 80,626 | 117,4 4 |
| Timber, square—Ash | 47,991 | 58,6 7 |
| " " Birch | 194,080 | 142,565 |
| " " Elm | 170,689 | 175,348 |
| " " Maple | 3,280 | ,098 |
| " " Oak | 516,544 | 666,7 4 |
| " " Pine, red | 52,439 | 59,[illegible]87 |
| " " Pine, white | 1,283,693 | 1,536,67 |
| " " All other | 26,352 | 28 882 |
| " " Total, timber | $2,289,068 | $2,579,986 |
| Wood, blocks and other for pulp | 711, 52 | 91 04 |
| Other articles of the forest | 141,654 | 104, 84 |
| Total, forest | $31,258,729 | $26,511,539 |

To show the relative value of the markets of Great Britain and the United States, tables are given of the exports of timber products to these countries in the years 1897 and 1898. Of pine deals practically none were exported to the United States, while Great Britain took them to the value approximately of $7,000,000 in the two years. Spruce and other deals were exported to Great Britain to the value of $13,500,000, as against $300,000 to the United States. The exports of planks and boards to Great Britain were valued approximately at $2,000,000, and to the United States over $12,000,000. Staves were shipped to Great Britain to the value of $105,000 and to the United States $1,000,000. Of pulp wood Great Britain took $70,000 and the United States $1,500,000.

Besides the above there were exported the following:

| | | |
|---|---|---|
| Barrels, empty | $ 3,331 | $ 3,413 |
| Household furniture | 115,863 | 242,177 |
| Doors, sashes and blinds | 285,161 | 3 4,492 |
| Matches and match splints | 151,276 | 195,770 |
| Mouldings and trimmings, etc | 16,121 | 14,779 |
| Pails, tubs, churns, etc | 12,789 | 19,666 |
| Spool wood and spools | 85,770 | 76,657 |
| Wood pulp | 741,959 | 1,210,421 |
| Other manufactures of wood | 240,047 | 284,664 |
| Total | $1,652,317 | $2,372,039 |

### EXPORTS FOR THIRTY-ONE YEARS.

Mr. Johnson has also compiled tables of the exports of manufactures of wood since the year 1868, showing the value and country to which exported. These show the total value during that period to have reached in value $556,613,330, or an average ef $17,948,817. The tables are given below:

### EXPORTS OF MANUFACTURES OF WOOD. (Separating Lumber.)

| Year. | Lumber. | Other Manufactures. |
|---|---|---|
| 1868 | $12,552,970 | $ 791,106 |
| 1869 | 13,969,368 | 788,610 |
| 1870 | 15,190,441 | 662,912 |
| 1871 | 15,403,173 | 760,624 |
| 1872 | 16,114,489 | 790,707 |
| 1873 | 20,025,872 | 788,233 |
| 1874 | 19,377,260 | 513,649 |
| 1875 | 16,451,185 | 653,791 |
| 1876 | 14,053,173 | 445,988 |
| 1877 | 14,457,097 | 607,648 |
| 1878 | 13,586,587 | 322,042 |
| 1879 | 10,185,137 | 453,938 |
| 1880 | 12,761,516 | 556,763 |
| 1881 | 17,139,770 | 526,024 |
| 1882 | 17,770,098 | 612,173 |
| 1883 | 18,444,021 | 552,498 |
| 1884 | 18,921,489 | 506,244 |
| 1885 | 16,085,540 | 662,902 |
| 1886 | 16,113,085 | 632,891 |
| 1887 | 16,519,088 | 963,985 |
| 1888 | 15,777,598 | 680,776 |
| 1889 | 17,871,834 | 678,567 |
| 1890 | 19,855,295 | 845,425 |
| 1891 | 18,971,389 | 961,485 |

## WINDOWS AND DOORS IN MARSEILLES.

United States Consul Skinner, of Marseilles, France, writes as follows regarding the market there for sashes and doors:

"A series of questions having been put to me concerning the possibility of introducing factory-made window sashes and doors in France, I wish to say, first, that the method of interior construction in this country does not resemble our own, and any manufacturer desiring to do business here should visit the country and study the local pecularities. All building is done to stay, and the light pine doors and sashes often used in America would not do here at all. Furthermore, there are no window frames in France that slide up and down as they do in the United States. The sashes are as long as doors, a double sash being made for each window, opening inward, clamped with a special fastening, and provided with interior and exterior blinds. In this southern country, where winds are severe, the outside shutters have immovable slats and are very heavy. Taking up the questions in detail, I have to say:

"There is no existing demand for factory-made doors. The notion prevails that ready-made doors are inferior to the hand-made article, and a demand would have to be created.

"As to shapes and styles in use, they are many. Sliding doors are unusual. As a rule, even large double doors swing on hinges. The dimensions of single doors of the ordinary types are: Height, 2.20 to 2.25 meters (7.22 to 7.38 feet); width, 80 to 90 centimeters (2.6 to 2.8 feet); thickness, 3½ centimeters (1.4 inches). Doors generally are hung on simple hinges. As no factory-made doors are sold, prices can not be quoted. For hand-made doors of the ordinary variety, the ruling price is 7 francs ($1.35) per square meter (10.76 square feet), or for double doors, 10 francs (1.93) per square meter.

"One builder ventures to say that from three to five thousand doors are used annually in Marseilles. No dependence can be placed on the guess. The consumption obviously depends on the amount of building. Doors used here are of local manufacture, the lumber generally coming from Sweden and Norway. There are no special door factories in this city."

The London Timber Trades Journal tells about a record in connection with the making of cricket bats that has just been established by a London firm of manufacturers. The firm recently purchased a gigantic willow tree which had been planted near the River Chelmer at Boreham, Essex, in 1835. When cut down it was found to weigh nearly 12 tons, was 101 feet long, and 5¾ feet in diameter. Out of this magnificent piece of willow no fewer than 1,179 cricket bats are said to have been cut from the best wood.

## THE TIMBER TRADE OF CAPE COLONY.

CAPE TOWN, SOUTH AFRICA, Sept. 20th, 1899.

Editor CANADA LUMBERMAN:

DEAR SIR,—Since my last letter appeared in the columns of your paper many changes have taken place in the conditions governing the timber trade of this colony, and I believe of the whole of South Africa. At the time referred to, the principal supplies of timber were brought from the Baltic and the port of Pensacola in South America, with small lots from Quebec and St. John, N.B. The most favored timber then (and for that matter at the present, only not to the same extent) was the Baltic deal, for the reason that builder's specifications invariably called for deals of an average length of about 20 feet, and these lengths were only obtainable from Norway and Sweden.

Within the past eighteen months, however, what is called here "Douglas Fir' or "Oregon," a wood hitherto unknown on this market, has made its appearance, and I understand it to be commanding a good place and a large sale. This wood has long been sought after for use in harbor improvements on account of its enormous length, and I believe it was on representations by the Harbor Board of Table Bay that the first logs were brought here. Since the time of its introduction it has been steadily growing in favor, not only on large works, but for building purposes also, and in conversation with one of Cape Town's most extensive timber importers recently, he bespoke for this wood a very large consumption, not only in this colony, but in all the ports of South Africa. This opinion seems to be well founded, from the fact that whereas only one cargo arrived at this port from British Columbia during last year, three cargoes have arrived up to the present date of this year, and more are expected, besides what has come from United States ports on the Pacific. During last year the United States product seemed to have preference with dealers here, but at the present time, for some reason, there seems to exist a preference for the Canadian, which will account for increased shipments from British Columbia. It may be that British Columbia mills are prepared to cut the most suitable specification for this market.

I understand, too, that one cargo which arrived from British Columbia was so far ahead of what had been hitherto received from American ports, insofar as grain and quality were concerned, as to give it first place at once. Be this as it may, there is no reason known here why British Columbia should not obtain a large share of the future trade with this country, providing she can supply the same quality of timber and on as favorable conditions as London and New York houses, acting as brokers for the American millman, offer, and it might be worth mentioning here that one New York commission house has been offering Douglas fir c.i.f. Cape Town at a lower price than English houses have been able to touch heretofore. It is the high freight from port of loading, coupled with the heavy expense of handling long timber at this end, which makes the price of an otherwise cheap cargo run into big figures before it reaches the yards of the South African importer, and it is possible in the particular instance referred to, that the New York commission house had an offer of low freight from a vessel near to or at the port of loading.

The following is a specification of a cargo such as would be suited to this market at any time:

DEALS AND SCANTLINGS.

Average length to be not under 30 feet.

| | | | |
|---|---|---|---|
| 4½ in. x 3 in | 20 to 40 ft | 20 | standards. |
| 6 in. x 3 in | " | 20 | " |
| 7 in. x 2½ in | " | 20 | " |
| 9 in. x 2 in | " | 10 | " |
| 9 in. x 3 in | " | 350 | " |
| 11 in. x 2 in | " | 20 | " |
| 11 in. x 3 in | " | 200 | " |
| 12 in. x 4 in | " | 25 | " |

Average length to be not under 45 feet.

| | | |
|---|---|---|
| 9 in. x 3 in | 40 to 50 ft | 200 to 300 pcs. |
| 11 in. x 3 in | " | |

LOGS.

Average length not under 40 feet.

| | | | |
|---|---|---|---|
| 9 in. x 9 in. | 30 to 50 ft | 50 | logs. |
| 12 in. x 12 in | " | 100 | " |
| 12 in. x 14 in | " | 50 | " |
| 14 in. x 14 in | " | 100 | " |
| 15 in. x 15 in | " | 50 | " |
| 16 in. x 17 in | " | 50 | " |

FLOORING.

Average Length 17 feet.

| | | | |
|---|---|---|---|
| T and G 6 in. x 1⅛ in | 12 to 24 ft | 15 | standards. |
| " 4 in. x 1⅛ in | " | 25 | " |
| " 6 in. x ⅞ in | " | 20 | " |

The value of such a specification as I have given at Cape Town to-day would be in the neighborhood of £10 sterling per St. Petersburg standard, for lengths up to 40 feet, cost freight and insurance, with a slight advance on longer lengths. No. 1 flooring is worth £12 2s 6d per standard and No. 2 flooring £11 5s per standard.

The following ships have discharged British Columbia timber at this port during the present year: "Kennebeck," 2127 tons; "John A. Briggs," 2110 tons; and "Undaunted," 1764 tons; and the "Harvester," 1494 tons, is expected. Apart from the business of this port, I believe The Lingham Timber Co. bring a considerable quantity of this timber to Delagoa Bay and the east coast of Africa.

If any of your readers are in a position to secure a low freight at any time, the opportunity might be seized upon to send in a cargo to this port in accordance with the above specification, as there would be no difficulty in placing it with some importer here. Another course is to offer the above or a similar specification to some of the several London houses representing the merchants here, among whom are Messrs. Mackie, Dunn & Co., Davis & Soper, and Findlay, Durham & Brodie, all well known firms.

The returns show that only one cargo arrived at this port from British Columbia during 1898, and two from United States, whilst Canadian ports have taken the lead by sending four ships already this year, which is a sure indication that the consumption of this timber is on the increase at the expense of the trade from the Baltic.

I shall be pleased to give further information to individual enquirers.

Yours truly,

THOS. MOFFAT.

---

SKETCH OF MR. MOFFAT.

The writer of the above contribution to THE LUMBERMAN is a son of the late Lt. Col. James Moffat, Brigade Major, Canadian Militia District No. 1, London, Ont. He was born at London on August 22nd, 1861, and resided

MR. THOMAS MOFFAT.

there until 1885, when he was admitted to practice as a barrister and solicitor of Osgoode Hall. He practiced at Chatham, in co-partnership with James Magee, Q. C., the present County Crown Attorney for the county of Middlesex, and at London until March, 1895, when he removed to Cape Town, South Africa, which has been his headquarters ever since.

Since his arrival in Cape Town, Mr. Moffat has been engaged in furthering Canada's interests in trade, and in the beginning of 1897 founded the firm of Moffat, Hutchins & Co., now one of the best known firms in the colony, and dealing exclusively in Canadian manufactures and products. His partner is Mr. William J. Hutchins, also a native of Canada. When Mr. Moffat reached South Africa, importers had not heard of Canada's manufactures, and were too conservative to give them a trial, so the most practical plan to adopt was the formation of a firm which would handle them and thus obtain for them a foothold in the market. The success which has attended his efforts has justified the means, as merchants are always willing to buy goods whieh are being sold by others.

In the early part of 1898 the Dominion government, recognizing Mr. Moffat's efforts towards trade extension, rewarded him by appointment as agent for the colony.

The business of handling Canadian shipments is left to the firm of Moffat, Hutchins & Co., whilst Mr. Moffat attends to his government office, looks for new fields of enterprise, and gives information to enquirers both in that country and in Canada.

---

## THE CARE OF BOX MACHINERY.

IN regard to the care of box-making machinery, there are general rules that apply here just as they do to any woodworking establishment, and these general rules are the things to be used for the foundation of any system for the maintenance of such machinery. The individuality, the variation owing to the special character of the machines and their work, is only a matter of detail and is easily kept up with if there are brains and system in the attempt, and if there are not both there may be a lack of money on the profit side of the ledger when the machinery has served for only a short while.

The model of ideal in shop arrangement has been pictured many times by mechanical writers, and with some variation, owing, partly, to a matter of individual taste. The general rules for observation in this are, an arrangement of machines in order that the stock may go through the necessary machines and come out at the finishing end of the shop with as little work and confusion as possible. Presume a beginning at the surfacing planer at the stock-receiving end, then step by step through the shop the material should come to each machine in the order of their work, without any circumventing or coming back again for any part of the machine work. Some consideration, however, must be taken as we go along of the machines themselves, and their connection with the driving power, or else in catering to the convenience of handling stock there may result a poor mechanical arrangement of machines. In conforming to the mechanical idea in shop construction we should bear in mind, first, that the machines and driving line of shafting should be so arranged that the belts going from the line to the counter shafts of the various machines may not all pull on any one side, but be distributed so as to pull against each other as much as it is practical to so arrange them so that they balance, as it were. This idea has been diagrammatically laid out heretofore, but every man can make his own diagram if he will only bear in mind that the idea is to get his line of shafting in the center, not necessarily of the building, but in the center of machine distribution, and if he has two lines of shaftings to the building he should not put them along each side wall, but divide the machine distribution into two parts and center each half with a line of shafting. The other general mechanical idea to be borne in mind is to try and get the heaviest driving nearest to the power end of the line. This cannot be easily conformed to in all cases, as that of distributing the counter shafting, for it is sometimes necessary to get a light machine near the power end, and likewise a heavy one away out toward the other end, but it is well to bear the idea in mind, and get all the heavy machines possible up near the power end of the driving line.

After the machines are all up each machine should be numbered on the body of the machine and the same number tacked up by the counter shaft. Of these a record or book should be kept, opening with the cost of the machine in detail, including belting and all connections, with date of application and name of manufacturer. This may seem like a lot of red tape at first, but by and by the advantage of it will become apparent. The millwright can enter on his book the repair expenses of each individual machine, and incidentally record the substance of his opinion of the trouble and worry of keeping the machine in good running order. Then the foreman in his book of estimates on the cost of getting out stock has something to conjure with in the number of these machines. It is easy, under such an arrangement, to get the record of each machine, and a comparison of books by the foreman and millwright would tell, without any guessing, when it would be advisable to discard a machine for something new. And, too, there is something fascinating about this positive knowledge of what you are doing once you get started at it, and instead of seeming like a useless rigamarole of a task, it will appear like the only real manner of business, and you will wonder why you did not take it up sooner.—Barrel and Box.

---

Hemlock shooks are beginning to be quite as popular as pine in the United States.

Foreign Subscriptions, $2.00 a Year.

ADVERTISING RATES FURNISHED ON APPLICATION

THE CANADA LUMBERMAN is published in the interests of the lumber trade and allied industries throughout the Dominion, being the only representative in Canada of this foremost branch of the commerce of this country. It aims at giving full and timely information on all subjects touching these interests, discussing these topics editorially and inviting free discussion by others.

Especial pains are taken to secure the latest and most trustworthy market quotations from various points throughout the world, so as to afford to the trade in Canada information on which it can rely in its operations.

Special correspondents in localities of importance present an accurate report not only of prices and the condition of the market, but also of other matters specially interesting to our readers. But correspondence is not only welcome, but is invited from all who have any information to communicate or subjects to discuss relating to the trade or in any way affecting it. Even when we may not be able to agree with the writers we will give them a fair opportunity for free discussion as the best means of eliciting the truth. Any items of interest are particularly requested, for even if not of great importance individually they contribute to a fund of information from which general results are obtained.

Advertisers will receive careful attention and liberal treatment. We need not point out that for many the CANADA LUMBERMAN, with its special class of readers, is not only an exceptionally good medium for securing publicity, but is indispensable for those who would bring themselves before the notice of that class. Special attention is directed to "WANTED" and "FOR SALE" advertisements, which will be inserted in a conspicuous position at the uniform price of 15 cents per line for each insertion. Announcements of this character will be subject to a discount of 25 per cent. if ordered for four successive issues or longer.

Subscribers will find the small amount they pay for the CANADA LUMBERMAN quite insignificant as compared with its value to them. There is not an individual in the trade, or specially interested in it, who should not be on our list, thus obtaining the present benefit and aiding and encouraging us to render it even more complete.

## SUSPENSION OF THE COASTING LAWS.

CANADIAN lumbermen, many of whom are vessel owners, are strongly opposed to the recent action of the Dominion government in suspending for the balance of the season the coasting laws of Canada, thus permitting American vessels to trade between Canadian ports upon equal terms with British vessels. By this action the Canadian vessel trade is placed in the same position as the lumber industry, that is, the United States citizens retain their own trade exclusively, and are given equal privileges and opportunities with Canadians in the Canadian trade.

The result of the suspension of the coasting laws will surely be detrimental to the interests of this country. Coming at a time when contracts have been made for new tonnage to the capacity of 300,000 bushels of grain, and when other contracts for additional ships are under negotiation, it has created a great lack of confidence in the policy of the government, which should be designed to protect Canadian interests.

It is pointed out that a Canadian railway company has been employing American bottoms for carrying grain from upper lake ports to a port on the Georgian Bay, and that one object in the suspension of the law is to permit this company to employ these vessels for carrying grain between the Canadian ports of Fort William and Parry Sound. On this point we cannot speak definitely, but certainly some influence must have guided the government in its action.

The carrying of lumber is not likely to be affected to any extent this year by this enactment. The trade is at present of small volume, but upon the completion of a 14-foot waterway on the St. Lawrence route, now almost accomplished, vessels will carry lumber from Georgian Bay ports to Montreal and Quebec for export to foreign markets. Then the admission of American bottoms to the Canadian trade would mean more than it does to-day.

This should be a non-political question. The principle should be recognized that the coasting laws should be designed to protect the national commerce, and should not be subject to radical changes.

## CANADIAN EXPORTS.

FROM a study of the tables of Canadian exports some comparisons are deduced which may not be uninteresting to the lumber trade. We have exported since Confederation, or from June 30, 1868, to June 30, 1898, home products to the value of $2,464,277,239. In 1868 our exports were valued at $45,543,177, while last year they reached $139,920,932. During the thirty-one years under review the exports of our manufactures amounted to $1,020,212,537, made up as follows: Manufactures of wood, $556,613,330; cheese, $218,241, 262; flour, $613,340,182; butter, $58,471,604; ships, $17,172,269; other manufactures, $108,373,890. Great Britain is our best customer, taking in 1898 over $93,000,000 worth. In 1882 the exports to the United States reached $41,700,000, but since that time they have steadily decreased, and last year were only $34,400,000.

Elsewhere in this issue will be found tables showing the value of the exports of manufactures of wood since Confederation. These tables are compiled by Mr. Geo. Johnson, Dominion Statistician, and are perhaps as nearly correct as it is possible to make them. Their value, however, is lessened by the absence of information as to what material was classified as manufactures of wood. It would appear from a perusal of the tables that nothing outside of lumber and partially manufactured lumber was taken into consideration. In 1868 the exports of manufactures of wood were valued at $13,344,076, while last year they were $22,874,817. The exports of the intervening years have varied between these figures, excepting in the case of 1897, when they reached $26,871,391.

It must be admitted that our exports of lumber have not increased in the thirty-one years under review to the extent which they should have done. From this we conclude that the foreign demand in ordinary lumber has been well supplied, and that home industries have consumed a much larger quantity of lumber. It is in the direction of manufactures of wood that we should seek to extend our foreign trade. The tables show that Great Britain purchased from us manufactures of wood to the value of $257,758,085. In that market we naturally meet competition from almost every wood-exporting country in the world, hence the great necessity of manufacturing our lumber as far as possible at home, thus bringing down freight charges to the minimum in proportion to the value of the goods.

Butter and cheese are responsible for a large increase in our exports. In 1868 the combined exports of these goods were valued at $2,318,585, while last year the exports are represented by $19,619,449. These figures have an especial interest for the lumber trade, inasmuch as they show the large and increasing demand for boxes in which to export butter and cheese.

## LOGGING REGULATIONS.

THE Department of Woods and Forests of Quebec has submitted to the lumber trade of that province some proposed amendments to the regulations governing logging operations. The main object intended to be accomplished by the new orders is the securing of more accurate returns of the quantity of timber cut on Crown lands. These regulations have not been favorably received by the lumbermen. While admitting the importance both to the government and to themselves of having accurate returns of the quantity of timber cut, they point out that the proposed changes are entirely impracticable, and that they would increase the cost of taking out logs to such an extent as in some instances would compel lumbermen to cease business.

For the first parapraph of article 13 of the regulations as they now stand, the following, according to the new laws, is to be substituted:

"Every such culler employed by a licentiate to measure timber must number each piece of timber measured by him, and inscribe the number in his book of measurements, and state opposite each number the variety and dimensions of said piece of timber. He must make a separate count for each shanty, following without interruption the order of numbers from one upwards. The book in which the log counter has entered the timber measured by him must at all times be subject to the inspection and usage of the bush ranger or other officer authorized by the commissioner to examine same, and must be transmitted at the end of logging season to the local crown timber agent, after having been sworn to by the culler."

This clause, it is contended, is unworkable. It would be a most difficult matter to number each saw log with the number of the shanty, number of the log, and size of log. Suppose the number of the camp was 3, number of log 10,199, size 14 inches; if properly marked it would appear thus: $\frac{5}{10,199}$. Under favorable conditions it would be possible to mark the log as ordered; but in the early autumn when the gum is oozing out of the log, later on when the logs have to be drawn through bush to the rollways, and still later on when the soft snow freezes to the end of the log, it would be exceedingly difficult and expensive to comply with the regulations, and a much larger gang of men would be required to take out a given number of logs.

Another clause of the proposed amendments reads as follows:

"Licentiates are strictly forbidden to place logs in the water in the fall, or to pile them on the ice in winter. All logs or other timber, without exception, must be put in rollways, above high water mark, and sufficient space must be left between each pile to allow the cullers and bush rangers to measure both ends of each piece of timber."

Nearly everyone familiar with the lumber business will, we think, admit that the above law, if made effective, would cause unnecessary hardship to the lumbermen and in the end re-act against the interests of the government. Logs are, of course, watered in all sorts of ways; but the popular method employed in the Ottawa valley and northern Quebec is to place them on the ice as soon as it is strong enough to carry the

horses. During the winter the logs sink to a greater or less extent. By this method there is saved the expense of clearing large spaces to pile them along the shores, which are usually very rough, also the expense of the second handling in the spring when time is of the most vital importance so as to take advantage of the first flow of water. If the logs had to be piled as proposed by the new regulations, they would all be frozen together and could not be placed in the stream in time for the spring freshets without great expense and loss of much valuable time.

In some instances logs are put into small streams in open water from the commencement of the logging season (usually about the first of September) up to the time that drawing on the snow and ice is commenced. This can only be done, of course, in the case of logs close enough to the water to be drawn in on the chain, but if these logs had to be piled along the small streams, it would require the clearing of miles of space along the banks, which, owing to the rough and rugged nature of many river banks, would entail a large expense.

Another serious objection would be the expense of keeping a large force of men to do the piling as the logs are drawn to the banks and of breaking the large rollways in the spring when the logs would be frozen together. It would also be necessary in many instances, owing to the nature of the bank, to roll the logs a considerable distance to the water, and before this could be accomplished the water in the stream would perhaps have lowered, and in addition to the extra expense, the probability of having the drive hung up would be increased.

The objections which we have enumerated are, we think, sufficient to show that the proposed regulations contain many objectionable features, the enforcement of which would seriously interfere with logging operations, without any material gain to the government. In this matter the authorities manifested a spirit of fairness by soliciting the view of the lumbermen before putting the regulations into force. No doubt in view of the representations which will come from the trade, the proposed measure will be freed from its objectionable features.

## EDITORIAL NOTES.

Can a lumberman be found who has not made money this year? We know of one firm who, after holding a large stock of lumber for several years, sold it last summer at an increased price which paid them many times over the insurance charges and other incidental expenses consequent upon keeping the lumber in their yards. Had they held the stock until the present time, they could have realized several thousand dollars more than they received a few months ago.

There is, we believe, a bright future for the hardwood industry of this country. Some lumbermen who have in the past operated exclusively in pine, but who find their supply of timber becoming exhausted, are now turning their attention to the hardwood timber on their limits. Within the past month a deputation of Ottawa valley lumbermen interviewed the Ontario cabinet and requested the government to grant licenses for the cutting of timber other than pine in Algonquin Park. The government were compelled to make the somewhat unintelligent response that no action could be taken at present, owing to the absence of accurate information as to the quantity of hardwood timber on the limits in question. This instance emphasizes the necessity of some steps being taken by the government to ascertain the quantity, location and variety of hardwood timber on the Crown lands of the province. If such information were obtainable, an expansion in the development of the hardwood industry would undoubtedly be witnessed.

The developments of the past ten days have demonstrated that the value of timber limits is steadily increasing. It wil be remembered that at the Ontario government sale of 1892 a thirty-six mile berth in the township of Morgan was sold for $373,650, the highest price ever paid for a berth of that size. Recently, however, this same berth has been sold to the Michigan Land & Lumber Company for a sum understood to be considerably larger than that originally paid for the property. The sale conducted by Mr. Peter Ryan on October 24th is another indication of the great wealth contained in our forests. For 108 square miles there were realized $679,500. And here it might be mentioned that a Michigan lumberman was a purchaser at this sale of limits to the value of $282,500. The result of the sale is a tribute to the shrewdness and business foresight of Mr. Peter Ryan and his associates. While we are not authorized to give the exact figures, it is well known that but a few months ago they purchased these limits for a sum not greatly in excess of $550,000. Now they have sold three-fourths of the property for $679,000, and refused to accept an offer of $125,000 for the unsold portion. It is safe to assume that at least an even $200,000 was made by the transaction.

## EXTENSIVE SALE OF TIMBER LIMITS.

The rotunda of the Board of Trade, Toronto, was crowded with lumbermen on the afternoon of October 24th, when Mr. Peter Ryan offered for sale the Comstock limits, on the Spanish River. Trill and Ermatinger were offered in full 36 mile berths, and Foster and Nairn in quarter sections of 9 square miles each.

The Canadian trade was represented by: Cook Bros. Lumber Co.; Victoria Harbor Lumber Co.; Georgian Bay Lumber Co.; Muskoka Mill and Lumber Co.; J. B. Smith & Sons; Parry Sound Lumber Co.; Imperial Lumber Co.; Conger Lumber Co.; Collins Inlet Lumber Co.; Ontario Lumber Co., all of Toronto; J. R. Booth, Ottawa; Pembroke Lumber Co.; Chas. McCool, Geneva Lake; John McNeil, Gravenhurst; Thos. Long & Bro., Collingwood; Robt. Thompson & Co., Hamilton; The Brennan Co., Hamilton; C. Beck, Penetanguishene: A. Barnet and Allan Frances, Renfrew; Egan, Mackie, Fraser and Eddy, of Ottawa; Booth & Shannon, George Gordon, J. W. Munro, Pembroke; Jas. S. Playfair, Midland; The Byng Inlet Co., Byng Inlet; Henry Lovering, Coldwater; Mr. Lomas, Sprague; J. & T. Conlon, Thorold; J. Ferguson, M. P., and J. McFadden, Ottawa; Geo. Paget, Sturgeon Falls; Jas. Scott, W. J. Sheppard, T. Sheppard, W. J. Irwin, Geo. McCormick M.P., Angus McLeod, F. J. Gillespie, Chas. Mickle, N. Dyment, Burton Bros., and others.

Michigan lumbermen were also there in great force, among whom we noticed Maurice Quinn, E. W. Sparrow, F. W. Gilchrist, Thos. Pitts & Co., W. L. Churchill, Hon. S. O. Fisher, Burrough & Rust, John Millen, Alger, Smith & Co., Saginaw Salt & Lumber Co., Hardy Lumber Co., Spanish River Lumber Co., and others. It was a gathering, as Mr. Ryan said, of the monarchs of the pine lumber trade. Sharp at two o'clock Mr. Ryan, accompanied by his solicitor, Mr. Frank Denton, Q. C., and Mr. Clarkson, entered the room, and was received with applause by the assembled lumbermen, for it was well known that he had purchased the limits as a private speculation and was going to make a test of the soundness of his judgment by putting them up to public competition. Never was any sale conducted in a more honorable manner, and certainly there has never been carried out a more successful transaction in buying and selling a group of timber limits than in this case.

After a few words on the growing scarcity of northern pine from the eloquent auctioneer, whose fame as a speaker on public questions is Dominion wide, the township of Ermatinger was offered and withdrawn at $125,000, after which came Trill, which was knocked down to Mr. C. Beck for $160,000; then in rapid succession came Foster and Nairn in nine-mile berths, which were sold off to the Victoria Harbor Lumber Co., J. W. Munro, Ferguson & McFadden, and W. L. Churchill, the latter representing a syndicate of Michigan lumbermen. As will be seen from the list, the total sales footed up to $679,500, with Mr. Ryan retaining Ermatinger for private sale. There was one action on the part of the auctioneer which elicited for him the deserved applause of the crowd of competing lumbermen. Just as the name of Mr. Churchill was declared the buyer of one of the berths, an advance of $2,500 was heard, but the auctioneer refused to receive the bid, though by so doing he was refusing some thousands of dollars additional profit. Mr. Frank Denton, Q.C., of the firm of Denton, Dunn & Boultbee, solicitors, of Toronto, and Mr. E. R. C. Clarkson, also of Toronto, attended to the legal and financial features of the sale, which were conducted and finished in a most successful manner; and we need not say that the best known timber limit auctioneer on the continent was highly congratulated by his friends on the outcome of this sale, which has given a still firmer character to the value of our forest wealth.

Herewith we give the complete result of the sale:

Parcel No. 1—Township of Ermatinger, 36 square miles, withdrawn at $125,000.

Parcel No. 2—Township of Trail, 36 square miles, sold to C. Beck Manufacturing Company, Penetanguishene, Ont., for $160,000.

Parcel No. 3—South-west quarter of Foster township, 9 square miles, sold to W. L. Churchill, of Alpena, Mich., for $82,500.

Parcel No. 4—South-east quarter of Foster township, 9 square miles, sold to J. W. Munro, of Pembroke, for $21,000.

Parcel No. 5—North-west quarter of Foster township, 9 square miles, sold to W. L. Churchill, for $132,500.

Parcel No. 6—North-east quarter of Foster township, 9 square miles, sold to W. L. Churchill, for $67,500.

Parcel No. 7—South-west quarter of Nairn township, 9 square miles, sold to Victoria Harbor Lumber Company, Toronto, for $80,000.

Parcel No. 8—South-east quarter of Nairn township, 9 square miles, sold to Victoria Harbor Lumber Company, Toronto, for $51,000.

Parcel No. 9—North-west quarter of Nairn township, 9 square miles, sold to Ferguson & McFadden, of Ottawa, for $33,000.

Parcel No. 10—North-east quarter of Nairn township, 9 square miles, sold to J. W. Munro, of Pembroke, for $52,000.

MY attention has been called to an inaccuracy in the figures I gave in this column recently showing the tonnage of the Manchester Canal. Mr. Frank Southern, of Manchester, from whom I received the data on which the paragraph was based, writes : "I fear I did not make myself clear ; the tonnage mentioned referred to tons of timber imported only, the tonnage of all goods inward and outward being, of course, vastly greater. The timber imports last year reached 212,996 tons, and will probably be considerably larger this year."

* * *

I HAD the pleasure of a chat the other day with Mr. Maitland, the well known lumberman of Owen Sound. I found him in excellent spirits as the result of the prosperity which, in common with others, his firm have enjoyed during the present year. He gave it as his opinion that the year 1899 was the most prosperous during the last twenty years for the lumber trade. In answer to my remark "that all things come to those who wait," Mr. Maitland replied, "Yes, but many could not wait long enough and so went under." He further expressed the opinion that Canada has now reached the point where she can be independent of the United States market as an outlet for her lumber. The only drawback to the trade this year has been the inadequate shipping facilities. The unusual activity in the iron trade had led to the employment of many more vessels than usual for the carrying of iron ore. On top of that came the demand for vessels for shipments of grain. This demand, as usual, came suddenly, and the period for shipments being short, every vessel that could be procured was brought into service ; indeed, many vessels that had gone out of service were refitted to a sufficient extent to be again put to use. Under these conditions great difficulty had been experienced by lumbermen in securing vessels to carry their shipments, and lake freights had advanced to a point which left no advantage in shipping by vessel, as compared with shipping by rail.

* * *

I FIND the portrait of a Canadian adorning the front page of a recent issue of the American Lumberman. It is that of James Moloney, who has worked his way in the business world until he has become the chief man in the Moloney-Bennet Belting Co., of Chicago. Born on a farm near Lindsay, Ont., and becoming dissatisfied with his surroundings, one summer day he started out into the world, bare-footed and arrayed only in a pair of jeans and a calico shirt. Of money he had none, but another boy who accompanied him was the possessor of an old trunk, which was sold for fifty cents. Arriving at Port Hope, he borrowed ten cents from his companion and invested it in apples. These he peddled out, renewing his stock from time to time until he acquired in profits the sum of seventy cents. Deciding to go to the United States, he obtained a position as cook on a steamer, for the purpose of getting across Lake Ontario. In Rochester he secured a position driving a mule on the Erie canal, following this work for three summers and spending the winters in New York city at whatever he could find to do. Then he returned to Canada, and when sixteen years old went again to the United States. At St. Louis he secured work and attended night school for six or seven years, acquiring in this way a fair education. In St. Louis he learned the wood-working business, going from there to Missouri to take charge of a saw mill. From Missouri he went to Little Rock and started to work on a farm, but after a short time removed to Chicago, which has since been his headquarters. He worked as a millwright, and in 1883 entered the leather belting business, seven years later organizing the Chicago Belting Company. Later he disposed of his interest in that company, and organized the company of which he is now the head.

* * *

ONE had but to enter the corridors of the Queen's Hotel in Toronto on the evening of October 24th to know that something had transpired in the city of more than usual interest to the lumber trade. There were to be found the lumber kings of Michigan—men representing great wealth and influence. They had come to Toronto in search of that commodity, timber, for which their appetites have in no sense been appeased by the act prohibiting the exportation of saw logs from the province. I noticed among them Hon. S. O. Fisher, of the firm of Turner & Fisher, and president of the Michigan Land & Lumber Company, of Bay City, who was for several years a representative to Congress, and of whom everybody spoke as a grand old man ; W. F. Churchill, of Alpena, the hero of the day, he having added to his possessions at the sale limits to the extent of nearly $300,000 ; Maurice Quinn, representing Col. Bliss, of Saginaw ; R. A. Loveland and R. H. Roys, of Loveland, Roys & White, Saginaw ; Bert Burton, manager for Pitts & Company, Bay City ; Edmund Hall, of Detroit, and F. W. Gilchrist, of Alpena. Not since the sale of 1892 has such a representation of Michigan lumbermen visited Toronto at one time. The topic of conversation was, of course, the sale held in the afternoon. Everyone admitted it was a grand success. "Peter Ryan deserves every dollar he has made, for he is a hustler and a hard worker," was one of the remarks during the evening. The question was asked why Michigan men continued to purchase limits in Ontario in the face of the government embargo. A common reply was that the courts would not allow the law to stand, and that next year logs would again be going across to Michigan. But, reading between the lines, one could easily see that they were not investing money entirely on the faith that this would be the case. In other words, as one gentleman remarked, "timber is a good investment wherever it stands." Herein lies the pith of the matter.

* * *

MR. Geo. Mabee, who operates a saw and shingle mill at Mabee, about eight miles from Tilsonburg, Ont., came to Toronto for the purpose of attending the sale of timber limits held by Mr. Peter Ryan on the 24th inst. Mr. Mabee's supply of timber has become well nigh exhausted, and he is looking around for a new site, being prepared to purchase a small limit either of pine or hardwood. In conversation with me Mr. Mabee questioned the policy of the governments in selling timber in large parcels. "Such a policy," said Mr. Mabee, "is opposed to the proper development of the lumber industry. It results in large capitalists buying heavily solely for speculative purposes, and shuts out the man of ordinary means when he wishes to buy timber with the object of carrying on a saw-milling business. I was told by a party the other day that one of the objects of the government had been to keep down the number of accounts open, but that seems to be a weak explanation, as the slight additional labor thus involved would be made up many times over by the higher prices which would be obtained for limits if put up in small lots." Mr. Mabee referred to the policy pursued by other governments, pointing out that in New Brunswick the government will not sell more than ten square miles in one berth, and that in California the maximum is 160 acres, and in that state the purchaser must become a resident for three months before he can get a deed of the property, and then he is required to take the oath of allegiance. There is, I believe, some truth in what Mr. Mabee says, but I do not think the Ontario government has been a great sinner in this direction. If my memory serves me, at the government sale in 1897 the largest parcel offered was less than ten square miles. At the great sale of 1892 some berths of 36 square miles each were sold, but by far the greater number of those offered ranged from 7 to 15 square miles. Allowing 3,000,000 feet to the square mile, a 36-mile berth would yield 108,000,000 feet, and many of the large pine mills in Ontario would cut this amount in a few seasons.

## THE NATIONAL HARDWOOD LUMBER ASSOCIATION.

CINCINNATI, OHIO, September 22nd, 1899.

Editor CANADA LUMBERMAN :

DEAR SIR,—We herewith enclose notice of our next meeting of the National Hardwood Lumber Association. We are possibly a little early getting out our notice for this meeting, but we want to say in reference to it, that we desire your co-operation in helping us all you can towards getting the lumbermen of this and your country together in the National Convention. The advantages of it are apparent in many ways, and we trust that you will give us your co-operation in this matter.

Yours truly,

NATIONAL HARDWOOD LUMBER ASSOCIATION,
W. A. BENNETT, President.

COPY OF NOTICE.

"It is with pleasure that I call your attention to the next meeting of our Association, which occurs at Memphis, Tenn., November 16th, and it is to be hoped that you will be there and your neighbors also. We must make this the meeting of the Association, and on account of the location being one of the best manufacturing and distributing points in the hardwood lumber belt, that of itself should appeal to you as a strong incentive to attend. The noted old fashioned hospitality of the southern people in general and the Lumbermen's Club of Memphis in particular should also warrant a pleasant social time. We will, however, at this meeting take up many things of special material interest to the trade, and it is to be hoped all will come with a view of occupying our time in business while at it."

Yours truly,

W. A. BENNETT, President.

The men employed at Blue's sawmill at Rossland, B.C., went on strike recently, demanding an increase in wages of twenty-five cents per day. The manager, Mr. Louis Blue, acceded to their wishes after but a temporary cessation of operations.

# CANADA LUMBERMAN

## WEEKLY EDITION

The Lumberman Monthly Edition, 20 pages } $1.00 PER YEAR { The Lumberman Weekly Edition, every Wednesday

*THIS PAPER REACHES REGULARLY THE PRINCIPAL LUMBER MANUFACTURERS AND DEALERS THROUGHOUT CANADA, AND WHOLESALE BUYERS IN GREAT BRITAIN, THE UNITED STATES, AND OTHER FOREIGN MARKETS.*

VOL. V. TORONTO, ONT., NOVEMBER 1, 1899 No. 41.

**CANADA LUMBERMAN**

PUBLISHED BY

**The G. H. Mortimer Publishing Co'y of Toronto, Limited**

*Confederation Life Building - TORONTO.*

Branch Office:
NEW YORK LIFE INSURANCE BUILDING, MONTREAL.

**Weekly Lumberman,** published every Wednesday. Contains reliable and up-to-date market conditions and endencies in the principal manufacturing districts and leading domestic and foreign wholesale markets. A weekly medium of information and communication between Canadian timber and lumber manufacturers and exporters and the purchasers of timber products at home and abroad.

**Lumberman,** Monthly. A 20-page journal, discussing fully and impartially subjects pertinent to the lumber and wood-working industries. Contains interviews with prominent members of the trade, and character sketches and portraits of leading lumbermen. Its special articles on technical and mechanical subjects are especially valuable to saw mill and planing mill men and manufacturers of lumber products.

☞ Subscription price for the two editions for one year, $1.00.

## WANTED AND FOR SALE

Advertisements will be inserted in this department at the rate of 15 cents per line each insertion. When four or more consecutive insertions are ordered a discount of 25 per cent. will be allowed. This notice shows the width of the line and is set in Nonpareil type; 12 lines make one inch. Advertisements must be received not later than 4 o'clock p.m. on Tuesday to insure insertion in the current week's issue.

FOR SALE.—THE CUT OF 2,000 ARPENTS of Hardwood Limits, only 22 miles from Montreal and on G.T.R. and I.C.R. "B.," care of P.O. Box 268, Montreal.

FOR SALE.

BIRCH FLOORING, KILN DRIED, HOLLOW backed, butted and bundled—suitable for factories, workshops, etc. The KNIGHT BROS. Co., Burks Falls, Ont.

WANTED.

TO BUY A GOOD SECOND HAND SAW MILL of capacity about 20,000 feet per day. Apply to GODERICH LUMBER Co., Goderich, Ont.

WANTED.

DRAUGHTSMAN, THOROUGHLY COMPETent man, one accustomed to engine and saw mill work preferred. WATEROUS, Brantford.

WANTED.

60 MILLION FEET SPRUCE LATHS, 2 TO 5 feet long. Full particulars on application to "G.A.M.A.," c/o CANADA LUMBERMAN.

FOR SALE.

BAND RE-SAW, DOUBLE SURFACER AND Matcher, Four Side Moulder, Sash Sticker, 50 h.p. Boiler and Engine, all in good repair. TORONTO MACHINERY SUPPLY Co., Tor nto.

WANTED.

CORDWOOD, BEECH, MAPLE, OAK OR Ash, dry, and Hardwood Slabs; Lath, Shingles and Lumber. Address, NORTHSIDE LUMBER & COAL Co., 860 Greenwood Avenue, Detroit, Mich.

WANTED.

TO CONTRACT FOR LARGE SUPPLIES OF Soft Elm Boards from 1 to 3 inches in thickness, 1st and 2nd quality; also Chair Stock—by foreign buyer now in Canada. Reply by letter to "Alpha," c/o CANADA LUMBERMAN.

WANTED.

SPRUCE BOARDS, 1ST QUALITY, WANTED, 50 standards; sizes 1 in. (full) thick by 3 in. wide; 1¼ in. by 3¼ in., and 1½ in. by 3½ in., or double above widths. Prices delivered Liverpool or Manchester to RILEY'S BILLIARD WORKS, Accrington, England.

WE WANT TO BUY 200,000 FEET OF 3-INCH Mill Culls (Pine), also four or five cars inch Roofing Boards; it does not matter how badly discolored these latter are. Address, M. M. SMITH, North Tonawanda, N.Y.

WE HAVE FOR SALE, OR WILL EXCHANGE for Lumber, one medium sized Carey Safe, one large Herring Office Safe, and one very large Herring Bankers' Safe, with burglar-proof steel vault. For particulars address M. M. SMITH, North Tonawanda, N.Y.

PIANOS AT WHOLESALE, OR IN EXCHANGE FOR LUMBER

PARTIES WISHING TO PURCHASE A PIANO can buy them of us at wholesale, or we will exchange them for an equivalent value in Lumber, Lath or Shingles. Address, "T. A. A.," c/o CANADA LUMBERMAN.

WANTED.

THE UNDERSIGNED INVITES CORRESpondence from Canadian manufacturers who can supply in large quantity Canadian Pine Doors and Windows. Goods must be of first-class quality as to material and manufacture. Address, HARRY G. BOYCE, Atheneum Chambers, 71 Temple Row, Birmingham, England.

SAW MILL FOR SALE.

THIRTY-FIVE HUNDRED DOLLARS BUYS Saw mill worth double this amount, if taken at once; 2 Boilers 120 h.p., Engine 100 h.p., Iron Saw Frame, Three Block Carriage, 2 good Saws, Double Edger and Trimmer good as new, Slash Chain, all in good running order, run this season; size of Mill, 30×100 ft.; good Boiler House, Blacksmith Shop, House, Barn, etc.; 400 acres of good Birch and Hemlock, also thousands of acres of timber near by. For particulars, address ALLEN CRESSMAN, Berlin, Ont.

## CANADIAN HARDWOOD LUMBER

MILLMEN AND OTHERS HAVING FOR sale please quote for:

**Soft Elm, 1" to 3" thick x 6" and wider, 1¼" x 14", 1" x 13" and wider.**

**Coffin Specifications, first-class stuff.**

**Prime Hard Maple, 1", 1¼", and 1½" x 6" and wider.**

**Also Prepared Flooring and Roller Block.**

State quantities offered, when available for shipment, prices f.o.b. winter ports and Montreal for first open water. Cash in New York against railroad bills of lading. Address "SPOT CASH," care of CANADA LUMBERMAN, Toronto.

### ENQUIRY FOR ELM BOARDS.

A foreign buyer now in Canada is desirous of arranging with manufacturers for large supplies of soft elm boards and a quantity of chair stock. His announcement appears in the "Wanted and For Sale" department.

### FIRES.

The planing mill of John Kaufman, near Cassel, Ont., was burned recently.

The saw mill of D. Purinton, near Richmond Corner, N.B., has been burned.

Fulton Bros.' saw mill at Fingal, Ont., was destroyed by fire on October 25th. The loss is $5,000, there being no insurance.

The steamer Fram has been chartered to take a cargo of deals from Miramichi, N.B., to Rochefort, France, at 70s. The steamer Rydal Holme takes deals from Quebec to Barcelona, Spain, at 70s.

### CURRENT TRADE CONDITIONS.

#### ONTARIO.

The drawing to a close of the shipping season has caused much activity in the lumber business of the Ottawa valley. Some shipments are being made by vessel to Montreal for export to Great Britain and South America, but the most urgency of demand at the present time pertains to the United States trade. Eastern wholesale dealers have visited the Ottawa valley and bought quite heavily of grades and dimensions suitable to their trade. This has given stability to the market. Reports from the Georgian Bay district are but a repetition of what has been said heretofore. Many enquiries are being received for stock, and particularly for the lower grades, the supply of which has become well nigh exhausted. The increase in manufacturing of all kinds in Ontario, coupled with active building operations this year, has been responsible for a large demand for the coarser grades of lumber, which have been steadily advancing for some months.

Many lumbermen are this winter increasing their operations in the woods, and there promises to be a large production of logs for sawing in the season of 1900. Several Michigan firms have already arranged to have their logs sawn at mills on the Georgian Bay.

#### QUEBEC AND NEW BRUNSWICK.

Each day witnesses an improvement in the spruce market of the eastern provinces. On account of high freight rates and short supply, very little stock is going forward to Great Britain, but there is quite a liberal movement of lumber, clapboards and shingles to the Eastern States, where the market has improved wonderfully of late. Before the mills commence operations in the spring practically all the stock will have been moved from the yards, and the season will open with unusually bright prospects. Bay of Fundy deals are now quoted at $9.50 to $10, and St. John deals at $10 to $10.50, but it would be difficult to find any considerable quantity that has not been purchased by the shippers. Extra cedar shingles are quoted at $3.15 to $3.25, taking Boston rate of freight, and the market is strong.

#### MANITOBA AND BRITISH COLUMBIA.

In some sections of Manitoba and the North-west Territories the country demand for lumber has been restricted on account of prevailing bad weather. Mills are catching up somewhat with orders, although the demand is such that dealers and manufacturers have no hope of accumulating any stocks for some weeks to come. A large quantity of British Columbia lumber and shingles has been sold this year in the North-west, and at satisfactory prices. The mills in British Columbia report no slackening in the demand. Building operations are proceeding unabated, and even at this late season of the year the erection of several large buildings is just being commenced.

#### UNITED STATES.

In the United States trade there has been a falling off during the past few days in the country demand and a partial cessation of building operations. On the other hand, the manufacturing demand for lumber shows no signs of abating. Reviewing the situation, there seems to be a lighter movement of pine stocks than has been the case for some weeks past. Box lumber and low grade stock of all kinds is in short supply, but in medium grades the supply is in better proportion to the demand. Receipts of lumber at eastern wholesale points, and particularly Buffalo and Tonawanda, have been quite large of late, but heavy shipments are being made to the east by the Erie canal, and winter stocks will be somewhat broken. Wholesale prices at Saginaw valley and Lake Erie distributing points have undergone the advance to which reference was made in our last issue. This advance ranges from 50 cents to $3 per thousand, the latter being on the upper grades. In another column details of the new list are given. The upward tendency in the spruce market has continued, a shortage of stock being reported at Boston, New York, and other large centres.

We believe that there has been a slight falling off in the demand for some varieties of hardwood lumber. Maple, for instance, is not as much enquired for as earlier in the season. Quotations at Boston are $27 for 1 inch, $29 for 1¼ and 1½ inch, and $31 for two inch. Elm holds its own at $30 to $31 for 1 inch and $32 to $33 for thicker.

#### FOREIGN.

British importers of wood goods are now turning their attention to arranging for next year's shipments, and there is much speculation as to the prices which will rule. We have not learned of any contracts having been made as yet, but it is said that shippers have refused offers higher than the prices which were realized or shipments this year. There is a strong

probability that prices for early spring shipments in 1900 will be higher than the closing sales of the present year. The South African war does not seem to have interfered with the timber trade; on the other hand, it has had rather an enlivening effect.

Holders of Canadian spruce deals report an unusually brisk demand for goods, and prices are steadily advancing. Within one month third quality spruce has advanced nearly 25s per standard at London, although at time of writing second and third quality are slightly easier, several contracts having just been concluded for seconds at £8 15s and for thirds at £8 5s. It is predicted that the top has not yet been reached, and that still higher prices will rule during the winter months. At Liverpool a cargo of 1,250 standards has been sold at £7 2s 6d, cost, freight and insurance, and £7 5s is being asked for West Bay and similar stock. There has also been increased firmness in Quebec pine deals of all qualities, and sellers are inclined to hold goods for higher prices.

From Australia comes the report of improved conditions in the timber trade. An advance has been made in the price of Oregon pine, and the outlook for the future is brighter than it has been for some time.

### STOCKS AND PRICES.

John Collins, of Honora, Ont., expects to get out about 100,000 ties this winter.

James Beveridge, of Parry Sound, has gone to Webbwood, Ont., to superintened the cutting of 10,000,000 feet of logs near that place.

Lindsay, Baird & Fulton, of Belmont, N.S., are prepared to let contracts to four jobbers to take out about 1,000,000 feet of logs each.

S. A. Baldwin, of Stanhope, Que., has been given a contract to get out 5,000,000 feet of logs this winter at Norton Mills for Mr. Fitzgerald.

Chew Bros., of Midland, Ont., have contracted with Joseph Turner, of Saginaw, Mich, to cut about 15,000,000 feet of lumber for him next season.

Vigars Bros., of Port Arthur, Ont., are preparing to get out a large number of logs this winter, but so far have been somewhat handicapped by the scarcity of men.

The extensive mill property, wharves, etc., of S. T. King & Sons at Kingsville, on the St. John river, about one mile from St. John, N.B., are being offered for sale by L. A. Curry, solicitor, of St. John.

Wm. Gordon, of Stratford, is supplying the timber and lumber for the Whyte Packing Co.'s factory in that city. The contract calls for over 600,000 feet, and his tender was in the vicinity of $12,000.

The bark Argilla cleared from Parrsboro, N.S., on October 26th for Cardiff, England, with about 1,000,000 feet of deals, shipped by M. L. Tucker for W. M. Mackay. This is the last vessel of this season's deal fleet of that port.

The Conger Lumber Co., of Parry Sound, Ont., has closed a deal with an American firm to saw 10,000,000 feet of logs for them during the season of 1900. The Conger Company will also cut about the same quantity of their own logs.

A syndicate has acquired the Violin Lake property in British Columbia. This property includes between 1,600 and 1,700 acres of the finest timber land in the Kootenay district and the whole area of Violin Lake in addition. It is understood to be the intention of the purchasers to operate quite heavily for some years.

J. & T. Conlon, of Thorold, Ont., are offering for sale their timber limits on the north shore of Lake Huron, comprising in all 191 square miles. The pine in the townships of Thompson and Bright has nearly all been cut off, but it is estimated that there is in these townships about 40,000,000 feet of hardwood timber, principally birch, red oak, hard maple, ash and hemlock.

The largest cargo of lumber that ever cleared from the port of Vancouver, B.C., was carried on the whaleback Elm Branch, which sailed for Shanghai, China, one week ago. The cargo consisted of 2,841,324 feet, valued at $26,000. The timber is for the Chinese railway, and will be used chiefly for bridge building. It is prouable that this steamer will be re-chartered to take another cargo from Vancouver.

Following is a comparative statement of timber, &c., measured and culled at Quebec to October 31st, 1899:

| | 1897. | 1898. | 1899. |
|---|---|---|---|
| Waney white pine, cu. ft. | 4,310,682 | 1,903,148 | 1,780,405 |
| White pine, cu. feet | 832,557 | 1,062,157 | 592,588 |
| Red pine, cu feet | 210,704 | 239,512 | 159,937 |
| Oak, cu. feet | 1,448,960 | 1,072,588 | 600,882 |
| Elm, cu. feet | 662,577 | 474,194 | 456,841 |
| Ash, cu. feet | 132,435 | 35,164 | 56,646 |
| Basswood, cu. feet | 5 | | |
| Butternut, cu. feet | 673 | 955 | 60 |
| Tamarac, cu. feet | 396 | | 415 |
| Birch and Maple, cu. feet | 271,176 | 112,500 | 244,530 |

The following prices were obtained at a recent auction sale held by Foy, Morgan & Co., London, Eng.: Pine—Ex Canadia, from Montreal—12 ft. 3 x 11 4th quality, £8; 12-13 ft. 3 x 10, £7 10s; 12 ft. 3 x 9, £7 10s; 12 ft., 3 x 8, £6 15s; 12 ft., 3 x 7, £6 15s; 12-17 ft., 3 x 5, £6 10s. Ex Monmouth, from Montreal—6 ft. 3 x 11 3rd quality, £8 15s. Spruce—Ex Yolam, from Montreal—13 ft. 3 x 9 2nd quality, £8 10s. Ex Montauk, from Montreal—10 14 ft., 3 x 5, £6 2s 6d. Sawn Birch—Ex St. John City, from St. John, N.B.—3½ x 4-18, 8d per cubic foot.

The new white pine list issued by Buffalo and Tonawanda dealers is an advance over the August list of $3 on uppers and $2 on selects, No. 1 cuts, most of the dressing and the greater part of No. 1 barn and box. No. 1 dressing is now quoted at $33.50 to $36.50, No. 2 dressing at $23 to $29.50 for inch, No. 1 barn at $22.50 to $30, No. 2 barn at $20.50 to $24.50, and No. 3 barn at $19 to $20.50. Box boards range from $17 to $20, and mill culls are quoted at $16.50. Prices on Norway piece stuff are based on $19.50 for 2 x 4 in the short lengths, and $20 for 2 x 6 and 2 x 8. No. 1 Norway dressing ranges from $22 to $30 and No. 3 from $18 to $20. Shingle prices remain unchanged.

### TIMBER SALE AT DUBLIN, IRELAND.

A sale of wood goods, consisting chiefly of Canadian pine and spruce deals, was held recently at Dublin, Ireland, by Wm. Graham. The prices realized, per Irish standard of 3,240 superficial feet, were as follows:

QUEBEC SPRUCE DEALS.—9 x 3 in., 11-12 ft., £13; 12 ft., £13 5s; 9 x 2 in., 9-12 ft., £12 12s 6d to £12 15s; 11-13 ft., £12 17s 6d; 12-13 ft., £13 2s 6d.

BAY VERTE SPRUCE.—4 x 3 in., 10-14 ft., £11 2s 6d; 13-15 ft., £11 5s; 16-20 ft., £11 2s 6d; 5 x 3 in., 10-11 ft., £11; 12-16 ft., £11 2s 6d; 15-18 ft., £11 5s; 6 x 3 in., 10-11 ft., £11 2s 6d; 10-16 ft., £11 3s 6d; 7 x 3 in., 10-12 ft., £11 5s; 11-14 ft., £11 2s 6d; 12-14 ft., £11 5s; 13-16 ft., £11 5s; 14-17 ft., £11 7s 6d; 8 x 3 in., 10-13 and 13-15 ft., £11 5s; 9 x 3 in., 12 ft., £11 12 6d; 13 ft., £11 10s; 13-14 ft., £11 15s; 14-15 ft., £12 5s; 15 ft., £12; 15-16 ft., £12 10s; 10 x 3 in., 10-13 ft., £11 12s 6d; 11-13 ft, £11 10s; 13-14 ft., £11 17s 6d; 14-16 ft., £12; 11 x 3 in., 11-13 ft., £11 15s; 14 ft., £12; 12 x 3 in., 10-14 ft., £11 10s.

### THE AUSTRALIAN MARKET.

The monthly timber report of Fraser & Co., Melbourne, reviews the Australian market as follows:

As we anticipated in our last report, an improved tone in the market has been experienced during the past month, better business from the country districts having been arranged, while the demand from our city and suburbs has been well maintained, and from both direction there are appearances of such continuing for at least some time to come. In no case has there been a decline upon our last valuations, but in several important lines an advance in prices has been secured, notably in flooring goods and Oregon, and the improvement made in these is likely to be sustained, while it is probable that very shortly we shall be able to advise higher rates as ruling for several other descriptions of timber which are placed upon this market.

The position of affairs with us should also be strengthened by the fact that c.i.f. values are increasing from many of the export countries which send supplies to here, and that generally the indications from these quarters point to still further higher rates ensuing rather than any lower values being manifested in the near future.

OREGON PINE. — Imports: 30,000 superficial feet, from Sydney. The trade having bought largely from supplies received last month, consequently no quantity of importance has been quitted within the past few weeks. Holders are, however, firm and £7 per thousand feet is now required, at which price some business has been done. Further sales are pending upon this basis.

LATHS AND PICKETS.— Imports: Laths, 1305 bundles. Both are wanted, but extremely scarce. Laths have been disposed of at 37s 6d, while pickets are quoted at £7 10s per 1000 pieces. An advance upon these rates will likely be obtainable when forward supplies are available.

### THE OUTLOOK FOR BASSWOOD.

BASSWOOD is so plentiful in the stump, so easily logged and handled compared with some of the other hardwoods, is capable of such rapid manufacture, and can be so quickly cured for market, that a possibility of a shortage in supply has not perhaps entered the minds of many buyers or consumers, says the American Lumberman. Nevertheless, the time has arrived when the likelihood of a shortage in the supply of basswood lumber within the next few months assumes such prominence that it is worthy of serious consideration.

The demand for basswood opened up early this year, and even in January and February there were quite a number of transactions in which mill cuts were involved. As the manufacturing season progressed, the interest of buyers in the basswood output increased accordingly. For several months there was a great deal of quiet buying and large bunches of stock were taken off the market. But there was apparently so much left that even those buyers who were most interested saw no reason to apprehend that there would not be enough basswood to go around. However, some new and unexpected factors entered the situation. Many wholesalers who had supposed they had acquired enough stock to carry them through the winter suddenly awoke to a realization of the fact that their stocks were dwindling and their assortments broken, and immediately set about looking for further supplies. In canvassing the northern mills they found that the

season's cut had been practically disposed of, that there was no appreciable stocks held in reserve by manufacturers and that for any considerable quantities the market was absolutely bare. This is the situation in basswood to-day.

One of the causes operating to reduce the available supply of basswood in so short a time was its general substitution for other woods, which it had supplanted heretofore in only an occasional or desultory way. Stocks of common basswood were largely picked up by the box-makers, who suddenly found themselves deprived of the corresponding grades in poplar, cottonwood and white pine. Molding manufacturers made heavy inroads upon the stocks of firsts and seconds and common, while the agricultural implement makers, the wagon manufacturers, the car builders and musical instrument makers all turned to basswood for the filling of the wants which they could not satisfy in other directions. The white pine dealers also furnished a requirement for large quantities of basswood, mostly in the shape of strips, for siding, ceiling and wainscoting. These large and unexpected demands rapidly dissipated the cut of basswood and it was shipped forward all summer, in most cases as fast as it was ready for the market. There is the very best of authority for the statement that, aside from the occasional ill-sorted stocks to be found in the hands of the wholesalers, the big basswood cut of last winter and spring has passed out of the market and the bulk of this is already consumed or in the hands of consumers.

Now that we know the disposition of last winter's cut it should not be difficult to figure on the future. The manufacturer of hardwood lumber in Wisconsin have lately had the scarcity of basswood brought home to them so forcibly that they are already looking forward to the winter's log cut. It is said that logs have lately been contracted for at $10, or fully $4 higher than they were selling at two winters ago. If this price is maintained, log-run basswood will therefore cost the operators $14 a thousand to put in pile; in other words, the cost of basswood at the mill in the several grades may be very close to the present selling prices from the yards.

With last season's cut of basswood exhausted and with no prospect of any addition to the visible supply of dry lumber until next May or June, a serious question presents itself to hardwood consumers. There is no surplus in the hands of wholesalers, and the demand is heavy. Meanwhile the season of basswood consumption in many industries is just beginning and will reach its height during the winter. In all probability it will be one of the biggest seasons in the manufacturing line, generally speaking, that has ever been known, and the consumption of raw material will be correspondingly heavy. Under these circumstances, and knowing that many of the premises herewith stated are not to be controverted, we do not think that we exaggerate in predicting still higher prices for basswood before the first of the year. No other conclusion can be reached, and as this year has broken many records in numerous channels of industry, it would not be out of the common for something of the same kind to take place in the basswood line.

## THE LATE T. G. HAZLITT.

ON October 12th death removed Mr. T. G. Hazlitt, president and general manager of the Dickson Lumber Company, of Peterborough, Ont. In March, 1898, Mr. Hazlitt was seized with an attack of paralysis. After a few months, however, he recovered, but in September last serious symptons appeared and death finally resulted.

Deceased was one of the most prominent business men and respected residents of Peterborough. He was born in the County of Armagh, Ireland, in the year 1823, and at the age of twenty-four came to Canada with his father, the late John Hazlitt, who died in August, 1869. He had received a good education, and shortly after his arrival in Canada obtained the position of principal in the Picton Grammar School, which he held for some time. In the year 1852 he removed to Peterborough and embarked in mercantile pursuits, which he carried on with varying success. In the year 1865 Mr. Hazlitt engaged in the lumber business as assistant to the late Samuel Dickson. Upon the death of Mr. Dickson in the spring of 1870, the management of the estate was transferred to the subject of this sketch. Although thrown upon his own resources, and with but a short experience in connection with lumber manufacturing, Mr. Hazlitt displayed remarkable executive ability and successfully guarded the large interests committed to his care. During the period since 1870 there have been many years of depression in the lumber business, under which many have succumbed, but Mr. Hazlitt's courage never flagged,

THE LATE T. G. HAZLITT.

his ceaseless energy never failed, and while others let the reins pass from their hands, he kept them well within his grasp, and by his untiring efforts added to the value of the property which had been left in his charge.

In 1885 a joint stock company was formed for the purpose of carrying on the business of the Dickson estate, under the name of "The Dickson Company, of Peterborough, Limited." Mr. Hazlitt at once became the managing director and shortly after its president, both of which offices he has held continuously ever since. Mr. Hazlitt was also the pioneer of electric lighting in Peterborough, and has been the president of the Peterborough Light & Power Company since its establishment nine years ago. In religion Mr. Hazlitt was a Presbyterian, and in politics a Liberal. In 1858 he married a daughter of the late Samuel Dickson. In his death the town of Peterborough loses a pioneer business man and respected citizen, and the lumber trade an esteemed member.

## "WANTED AND FOR SALE."

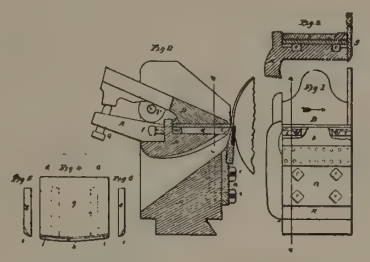
Persons having for sale or wishing to purchase a particular lot of lumber, a mill property, timber limits, second hand machinery, etc., in fact, anything pertaining to lumbering operations, will find a buyer or seller, as the case may be, by placing an advertisement in the "Wanted and For Sale Department" of the CANADA LUMBERMAN Weekly Edition. Testimonials to the value of this department by those who have given it a trial state that the results of advertisements were frequently better than anticipated. The cost is comparatively small. Mill owners might, with profit to themselves, make use of this method of advertising their stock to a still greater extent.

## RECENT CANADIAN PATENTS.

PATENTS have recently been granted in Canada for the following devices of interest to lumbermen and woodworkers:

### SHINGLE SIZER AND EDGER.

Leander Fox, of Lake Arthur, Lousianna, has been granted a patent for a shingle sizer and edger. It consists of the combination with the main frame, the saws, the lower feed roll held in close relation with the saws and adapted to be removed through the space between the same and the end bar of the frame, and the saw guard secured to said end bar and provided with guide blocks adjustable longitudinally of the machine; the combination of the main frame having the vertical end member 6, the removable vertical guide 7, vertical sliding frame located between the end member 6, and the guide 7, the upper rolls journalled on the sliding frame, the lower rolls, springs for forcing the upper rolls downward, weighted levers fulcrumed at a common point and engaging the sliding frames, etc.

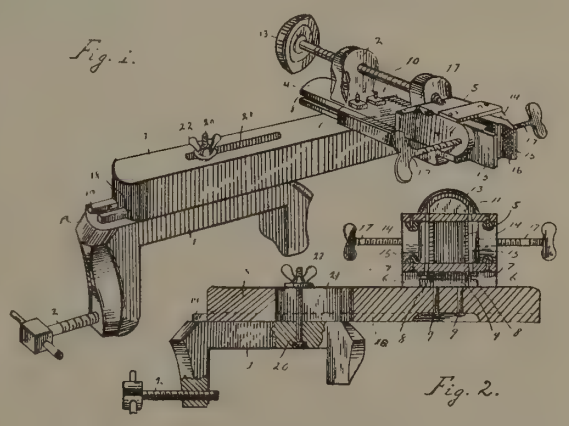


VENEER CUTTING MACHINE.

To G. E. M. Lewis, of Truro, Nova Scotia, has been granted a patent for a veneer cutting machine, as shown in the accompanying illustration. The claim is for a machine, the knife block combined with the curved knife secured thereto, said knife part being provided with grooves, the pivoted clamp 3, the screw Q, the presser bar g held in position by the clamp, two chamfering knives fitted in the grooves of the knife block and held in position by the presser bar, and the screws for adjusting the knives.

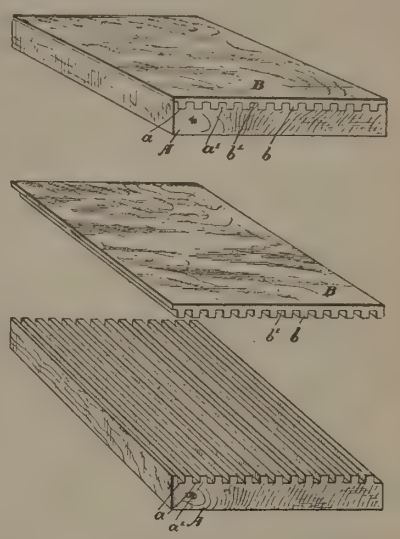
### METHOD OF PRESERVING WOOD.

The Electric Fire-Proofing Company, of New York City, has been granted a patent for a method of preserving wood. It consists in enveloping the wood within a closed receptacle with an atmosphere saturated with aqueous vapor maintained at about 110 degrees to 200 degrees Fahrenheit, to soften and open the wood, then producing a vacuum and removing the vapor and water from the wood, impregnating the wood uniformly throughout with the fire-proofing solution under pressure, and finally drying the wood at a temperature ranging from 85 degrees to 125 degrees Fahrenheit; the product being fire-proofed wood impregnated uniformly throughout and maintaining its natural color, electricity and tensile strength.



CIRCULAR SAW DRESSER.

Patent No.63,636 has been granted to H. L. Bee, L. M. Lang and C. M. Lang, of West Virginia, for a circular saw dresser, as shown herewith. The claim is for a saw dressing machine having pivotal space jaws mounted upon a support for angular adjustment with relation thereto, and provided with seats for an abrading object, and means for angularly adjusting the jaws to vary the angular position of the abrading object with relation to the plane of a saw blade, and a feed screw for adjusting its position of the slide, a clamp for engagement with the frame of a sawing machine, a supported bar upon said clamp for adjustment in a direction tranverse to the plane of the saw, a clamping device for securing the supporting frame at the desired adjustment, a guide carried by the supporting bar, a slide mounted upon said guide for adjustment parallel with the plane of the saw, means for operating the slide upon its guide, and emery stone engaging devices carried by the slide.



METHOD OF MANUFACTURING LUMBER.

A patent has been granted to David Gilmour, Trenton, Ont., for a new method of manufacturing lumber, as shown in the illustration. The claim is for a lumber product comprising a low grade base piece of wood having a plurality of grooves upon the side thereof, and an outer high grade layer or piece having corresponding layers and grooves formed on the low grade piece provided with a plurality of projections and recesses registering, fitting into, compressed and interlocking with the tongues and grooves of the base, whereby the surface on the side of the low grade piece is covered by the superimposed high grade piece, and a suitable water-proof cement for securing the tongued and grooved sides together.

## FOREIGN MARKETS.

THE Department of Trade and Commerce at Ottawa has received a communication from Mr. Harrison Watson, curator of the Canadian section of the Imperial Institute, London, asking for the name of Canadian manufacturers of maple skewers.

According to Mr. Sidney A. J. Churchill, British Consul at Palermo, Sicily, there is a chance for Canadian timber merchants in Sicily. He states that the pitch pine and other timber used there is purchased in Genoa or other continental ports, and points out that Canadian exporters might secure a share of the market.

The High Commissioner of Canada in London, England, has received the following enquiries: From a firm of importers desirous of arranging for consignments of Canadian wood pulp; from a London firm wishing to correspond with Canadian manufacturers of turnery and white birch caps and brush handles for mucilage bottles.

Mr. Edouard Hermann, of Antwerp, Belgium, recently made a tour of Canada in the interests of a large commission firm. Belgium, he says, has a population of 6,000,000 people on a very small area, and they cannot raise one-tenth of the produce required. Lumber will find a ready market there and is nominally free of duty. His firm are prepared to buy and pay spot cash for good lumber.

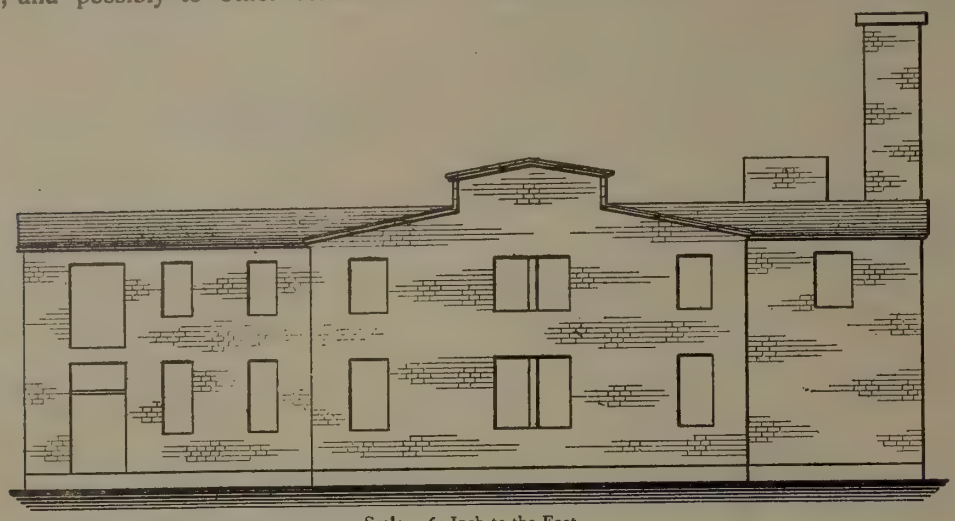
Mr. D. M. Rennie, Dominion government agent in the Argentine Republic, in a letter to the CANADA LUMBERMAN, says: "As regards spruce, on account of some new regulation as to cattle fittings on steamers, there is not so much used as formerly. I expect that the Argentine government will only reduce the special duty of ten per cent. for war supplies one-half in place of removing it, according to law."

The Magnolia Metal Co., of New York, have recently completed arrangements whereby the Q. & C. Company, of Chicago and New York, become the exclusive agents for the railroad trade for magnolia metal for the United States, Mexico and Canada, and the Metal Sales Company, 15 South Water Street, Cleveland, Ohio, have been appointed sole agents for Ohio, Indiana and Michigan.

## DESIGN FOR A PLANING MILL.

A CORRESPONDENT of Carpentry and Building sends the accompanying drawings of a planing mill, concerning which he says :

As being of interest to the correspondent in question, and possibly to other readers of the paper, I send floor plans and elevations of a mill that I drew about three years ago for a person who contemplated erecting a new mill near Philadelphia. In the present instance it will be seen that I have tried to arrange the machinery in the mill in such a way as to be most convenient. Referring to the floor plans, it will be seen that the machines are numbered, as they can be more readily indicated in this manner, and by less confusion than by writing the name of each one on the drawing.



Scale, 3-64 Inch to the Foot.

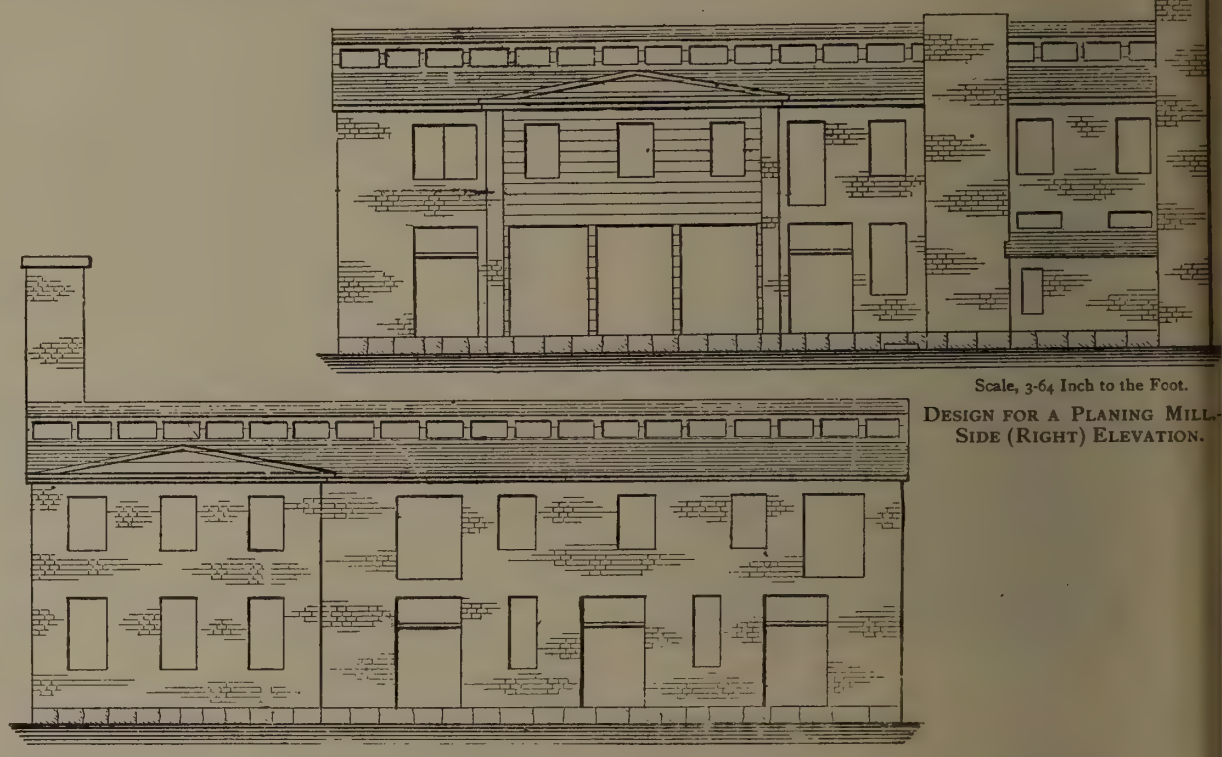
DESIGN FOR A PLANING MILL.—FRONT ELEVATION.

In connection with the first floor plan, A A, &c., are work benches. No 1 is a pulley stile mortiser, No. 2 a jointer with 14-inch cutter, No. 3 a Universal saw bench, No. 4 a molding machine with 6-inch cutter, No. 5 a rip saw, No. 6 a heavy band saw, No. 7 a molding machine with 10 inch cutter, No. 8 a swing cut off saw, No. 9 a large rip saw, No. 10 a double surface planer, No. 11 a rip saw, No. 12 a molding machine with 7-inch cutter, No. 13 a rip saw and No. 14 a swing cut-off saw.

On the second floor, B B, &c, are work benches. No. 15 is a light mortise machine, No. 16 a rip saw, No. 17 a sash and shutter clamp, No. 18 a tenoning machine, No. 19 a horizontal boring machine, No. 20 a sand papering machine, No. 21 a molding machine, No. 22 a blind slat tenoning machine, No. 23 a jig saw, No. 24 a light band saw, No. 25 a cylinder sand papering machine, No. 26 a single surface planer, No. 27 a boring machine, No. 28 a jointer with 16-inch cutter, No. 29 a Universal saw bench, No. 30 a tenoning machine, No. 31 a mortising machine, No. 32 a door clamp and No. 33 a turning lathe.

The engine, it will be noticed, is placed in the basement in order to get it as near as possible to the center of its main work. There is also a machine shop in the basement, as it is supposed that the engineer will have time to repair the machines, make bits and sharpen the knives. He has all his work in the basement, and is able to watch his engine at the same time. The floor of the boiler room is level with the floor of the basement, so as to make it convenient to the engine. It will be noticed that there is a dry-kiln on one side of the main building opening into the main floor at one end, while the other end opens to the railroad track at the side. The room is laid with pipe on the floor and heated by the exhaust steam from the engine. The room over the dry kiln, opening on the second floor, is used for glueing purposes, and is fitted with glue pans and pots. There is a coil pipe for heating veneers, also a veneer press and a large door clamp.

The building is arranged for the frame makers to work on the first floor in the "L" of the building, and for the heavy machine work, such as cutting out, planing and working moldings, to be done in the main part of the building. On the second floor of the "L" are made the sash, outside blinds and shutters, and here also are the inside blind makers, the work of the different



Scale, 3-64 Inch to the Foot.

DESIGN FOR A PLANING MILL.—SIDE (RIGHT) ELEVATION.

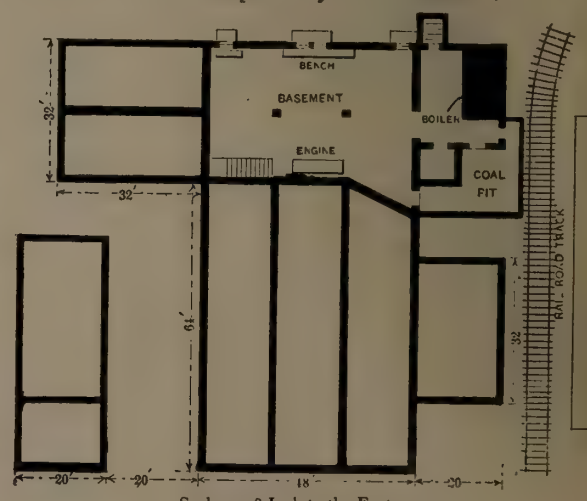
Scale, 3-64 Inch to the Foot.

DESIGN FOR A PLANING MILL.—SIDE (LEFT) ELEVATION.

FIRST FLOOR. Scale, 3-128 Foot to the Inch. SECOND FLOOR.

DESIGN FOR A PLANING MILL.

divisions extending into the main building. The balance of the space on the second floor is intended to be occupied by door makers, stair



Scale 3-128 Inch to the Foot.

DESIGN FOR A PLANING MILL.—GROUND FLOOR.

workers, bulks, &c. An inspection of the second floor plan shows that there is an office for the foremen and his draftsmen, which is to be in-

closed by sash, so that observation can be made of what is going on in the mill. At the left of the main building are the offices and warerooms, which are built two stories high to correspond with the other structures.

To run a mill of this size to its full capacity would require a bookkeeper, a man to estimate, one to make out orders and make measurements, a main foreman and his assistant, an engineer, a teamster, and 35 mechanics, both bench and machine hands. I trust that what I have given may be of some benefit to the readers of the paper, and I would be glad to hear from any of them on this topic through the columns of the paper.

## VANCOUVER ISLAND TIMBERS.

WHEN William J. Sutton, of Victoria, B.C., was in the Lumberman office the other day he told some very good stories of the timber growth of Vancouver Island, with which he is very familiar and in which, as president of the Sugton Lumber Company, he is interested. Mr. Sutton is a geologist by profession, has recently been occupying a professorship at the University of Michigan, and scientific habits have enabled him to make unusually careful observations of the facts as to the growth and characteristics of timber in relation to the soil.

The red cedar he considers practically indestructible. He has found fallen trees six feet in diameter with 6-foot cedars growing on top of them, embracing with their roots the fallen trunks, which must have lain in that position for centuries and are now perfectly sound except that the sap has rotted away. But as the sap on the red cedar is seldom over two inches thick, the size of the tree was hardly lessened. The firs also have very thin sap, perhaps the larger and most rapid grower not exceeding 2½ inches.

The cedars under favorable conditions sometimes grow to an immense size. He relates that once when he was conducting a surveying party, running a l ne through the forest, one of the party got lost in going around a cedar. It was a tree fifteen feet in diameter which lay directly in the line of survey. It had three or four blazes upon it. After passing it some distance, a member of the party was sent back to pick up some tools left on the line of the survey. He came to this cedar, which was more than fifteen feet in diameter at the roots and surrounded by underbush and other trees, became confused, and went clear around it and never discovered his error until he struck camp again.

In Mr. Sutton's opinion, the growing life of a cedar is about 1,500 years, when there begins a period of gradual deterioration. He says that he has no doubt that there are a good many of these trees standing in the forest of the Pacific coast that are at least 2,000 years old. After about 1,500 years heart rot sets in and death ensues after a few centuries more. These exceptionally large trees, however, are not the best for lumbermen, for Mr. Sutton thinks they are an example of arrested growth as far as height is concerned, the trunk being a good deal shorter than in trees of smaller diameter. The ideal red cedar will be from six to twelve feet in diameter with a maximum height to the first limb of 200 feet. The best timber, however, is still smaller, ranging from 5 to 8 feet in diameter. He says that the cedars stick very closely to limestone areas, where they are found in their maximun and best development.

# THE NEWS.

### CANADA.

—J. F. Boyd has opened a lumber yard at Minnedosa, Man.

Mr. Shaw, of Elmvale, intends establishing a saw mill at Phelpston, Ont.

—A company is being formed at Kentville, N. S., to establish a saw mill.

—Simon Seguin, of Embrun, Ont., has purchased a new engine for his saw mill.

—Shook & Arnott, saw mill, Lemon Creek, B.C., have sold out to Winlow & Bell.

—The Granby Box Company, of Granby, Que., is erecting extensive lumber sheds.

—Wm. Reid has been appointed curator of the estate of Quinn & Allard, saw mill owners, Conception Station, Que.

—It is reported that the Eastman Lumber Co., of Eastman, Que., have decided to close their saw mills at that place.

—W. L. Shields, of Coboconk, Ont., has purchased the Revell mill property and is just completing a saw and shingle mill.

—The Arrow River and Tributaries Slide & Boom Co., Limited, has been granted an Ontario charter, with a capital of $20,000.

—Chas. Warder, a band saw filer in Cook's mill at Sprague, Ont., and a native of Midland, was caught in a belt and instantly killed.

—W. W. Carter, of Fesserton, Ont., has recntly made extensive improvements to his mill, having put in a band saw and an electric light plant.

—James Forbes, recently of the Bronson & Weston Lumber Co., Ottawa, has gone to Winnipeg to take charge of a gang of men on railway construction work.

—It is said that Hilyard Bros., of St. John, have commenced the erection of a saw mill in the parish of Burton, Sunbury county, where they own a block of timber land.

—The McKee Machinery & Lumber Co., Limited, is seeking incorporation, with capital of $15,000, head office at 68 Bank street, Ottawa, and branches in New York and Boston.

—Incorporation is being asked for Randolph & Baker, Limited, to take over the lumbering business of Randolph & Baker, St. John, N. B. The capital is fixed at $80,000.

—It is the intention of Messrs. Mohr & Ryan, Killaloe Station Ont., to take out during the coming winter a large quantity of cedar poles, posts, etc., for next season's delivery.

—It is estimated that over 1,000 men have left Hull and vicinity in the past three months to work in the lumber woods. This is nearly three times the number that left in former years.

—E. A. Walker, of New York, has just secured a second large contract for machinery to be installed in the Ottawa Carbide Co.'s works at Ottawa. The contract is for a 60 ton travelling crane for the power house.

—The Tracadie Lumber Company, whose mills are at Tracadie, in Gloucester county, N.B., is about to construct a box factory to manufacture box shooks for the British market. The resident manager is Mr. B. H. Foster.

—At the recent fair at New Westminster, B.C., Messrs. Hardie & Thompson, of Vancouver, exhibited a self-oiling, reversing, three cylinder engine of five horse power, which occupied a space less than one foot square. This engine is said to be very suitable for the operation of portable saw mills.

—Attention is called to the professional card in another column of the firm of Denton, Dunn & Boultbee, solicitors, Temple Building, Toronto. The members of this firm have had great experience in, and are recognized authorities on questions relating to timbering, lumbering and milling interests.

—A feature of the Canadian forestry exhibit at Paris will be a section of Douglas fir 15 feet in diameter, and, according to naturalists, 600 years old. The tree was felled on Vancouver Island, between Victoria and Nanaimo, and as a branch railway track had to be built to the place, it cost $1,500 to get the section out to the main line of the C.P.R.

—When the improvements to the Parry Sound Lumber Co.'s mill now under way are completed, it will be one of the most modern in Western Ontario. The dam is being rebuilt, and the water wheels will be put in shape, the foundation of the mill overhauled, and a boiler house erected for the purpose of using steam feed apparatus for the circular and band saws. The machinery to be put in will include a double cutting band, circular and gang saws. It is the intention of the company to operate the mill next season.

—During the past month an English syndicate has taken over the business of Alexander Gibson & Sons at Marysville, N. B. The assets include the Gibson cotton mills, saw mills and timber limits, the Canada Eastern Railway, and much property in the town of Marysville. The company is now paying $35,000 per month in wages, and exports annually lumber to the value of $1,000,000. The cotton factory is the largest in the Maritime provinces.

### FOREIGN.

—For the eight months ending August 31st, 1899, the timber imports of Great Britain were 5,631,209 loads, against 4,999,902 loads for same period in 1898 and 6,061,940 loads in 1899.

—In the erection of grand stands for the Dewey reception in New York, there was consumed 7,758,904 feet of lumber. This was furnished by thirty-five different firms, and taking an average of $22.50 per thousand, the value would be $174,575.32.

—The United States exported $420,256 worth of box shooks the first eight montns of this year, against $251,643 for the same period of 1898, also $781,870 worth of sash, doors and blinds, against $671,315 last year in the same eight months. These figures are not tremendously large, but they show a steadily increasing export trade.

—There is a little Utopia at Orsa, in Sweden, where a community has sold about a million's worth of timber in a generation, and has in consequence no taxes to pay. By judicious planting they hope to realize as much income every thirty years. The railways, telegraphs, telephones, schools, and many other institutions are all free.

In December last Mr. Jas. Penner, of Derby, bought all of Mr. Fulford Cunningham's elm then standing, and paid $25 for same. Shortly afterwards, elm having advanced very much in price, Cunningham returned Penner the purchase money and refused to carry out the contract, alleging that as the sale of standing timber is technically a sale of land and that as writings are necessary in order to transfer the latter, there was no contract on his part because no writings had been entered into. Penner sued, and Judge Morrison at the Division Court awarded him $60 damages.

# WOOD PULP DEPARTMENT

## PINE AS A PULP WOOD.

TORONTO, Oct. 23rd, 1899.

To the Editor of the CANADA LUMBERMAN:

DEAR SIR,—I have carefully read your last issue of the LUMBERMAN, and note with pleasure that you are giving more attention to the pulp industry. This great and growing industry should have every assistance, and such a paper as THE LUMBERMAN is in a position to render it great service.

I note an article mentioning a few woods which are considered as likely to be rivals of spruce as our principal material for pulp making. Some of these enumerated in your article will, in special localities and for special reasons, reach some importance, but the bulk of paper pulp will be made from spruce and its allied woods for a good many years to come. Investors need have no fear that capital invested in spruce limits and pulp mills is likely to be lost because of a substitute being found for spruce. There is no substitute in sight, as far as I know, except for special grades of pulp, which can hardly be considered as competitors for spruce "news" pulp.

Now, there is no doubt that nearly all kinds of wood can be manufactured into pulp and paper, but the question for the pulp maker is, Will it pay? There seems to be some discussion regarding yellow pine, and also the short-leafed variety, for pulp making. From my personal experience I do not think these woods will amount to anything for this purpose, especially in Canada, where there are at present such large tracts of good spruce, which can be obtained at $2.50 or $3 per cord, laid down in the mill yard.

In the case of the two woods mentioned, the principal objection is the presence of resin. This must be got rid of, and if the process for doing so is not cheap enough, or if the by-products of tar, etc., do not bring in sufficient returns, the use of pine for pulp making will never assume any considerable proportions. There are other objections to its use which, though not so important as that mentioned, will seriously act against its use. I think pine will be found to grind much easier than spruce, especially if the wood is at all softened during the process of extracting the resin. This is an advantage, and will to some extent increase the output in tons per horse power. The pulp made from it will be cream yellow in color, or darker, will be soft in texture, close—or short and mealy—in grain, lacking the tough, strong character of the spruce. It will be ground in short fibres of comparatively large cross-section, which will be difficult to pass through the screw plates. This latter is, however, largely a matter of the degree of sharpening given to the stone and the amount of pressure used in grinding.

The process for extracting the resin will have to be one which does not injure the fibre or discolor it in any way, otherwise the pulp will be useless as a first-class article.

In Ontario the supply of spruce is as large, or will soon be as large, as that of pine. This means that the supply of pine is of more value as lumber than as pulp wood. It is not likely, then, that under these conditions much pine will be used in this way, especially as the pulp would not bring as high a price as that made from spruce, on account of its inferior quality.

The qualities required in a good "news" pulp are whiteness and strength, with a fibre uniform in size and of a good length, giving toughness. These qualities depend to a very great extent on the wood or material used, but evenness and uniformity will always depend on the skill used in sharpening the stones, the judgment of the pressure, and the care taken in choosing the screen plates.

Whatever may be said for or against pine, of either the long or the short-leafed variety, as a probable substitute for spruce in pulp making, it will never be considered as a question of much importance by Canadians.

W. H.

## THE LATE J. C. WILSON.

ONE prominently connected with the paper and pulp industry of Canada passed away on October 9th, in the person of Mr. J. C. Wilson, principal of the firm of J. C. Wilson & Company, paper makers, Montreal, with mills at Lachute and St. Jerome. Mr. Wilson came to Canada from Ireland when but an infant, was educated at McGill Normal School, taught school at Beauharnois from 1859 to 1862, then removed to Belleville and later to Toronto. In 1863 he secured a position with T. W. Strong, publisher, New York, but in a year or two returned to Montreal, becoming book-keeper for Angus Logan & Co., now the Canada Paper Co.

In 1870 Mr. Wilson started in business for himself with a small capital, and gradually worked up the ladder of success until at his death he was one of Canada's most prominent paper manufacturers. He built his paper mill at Lachute in 1880, since which time considerable additions have been made thereto.

## PULP MARKET IN FRANCE.

MR. Wohlfarth, general director of an importing company of Paris, France, and representative in that country of the Sault Ste. Marie Pulp & Paper Company, was recently on a visit to Canada, and gave some information as to the possibility of increasing our export trade in pulp. The French market, he says, is accessible only to dry pulp, by reason of the high freight that must be paid. Dry pulp occupies 90 cubic feet to the ton weight, while the regular space allowed for a ton is only 40 feet. Special freight rates are therefore applied to pulp, and all it can stand is a freight of 20s. per ton to Spain and Marsellies; the Compagnie trans-Atlantic charge 20 francs from New York to Havre. The Sault Ste. Marie Pulp & Paper Company is about the only one that makes dry pulp, although recently the Laurentide Pulp Company made a start in that direction. As the small mills in Canada are provided with apparatus for wet pulp only, and as this wet pulp contains 50 per cent. of water, Mr. Wohlfarth says that it would be necessary to have a freight rate of 10 francs or 10 shillings at the most in order to place it on the market in Spain, Portugal or Belgium to compete with the Norwegian pulp. If the eastern mills could supply dry pulp they would have a great advantage in transportation charges over the Sault Ste. Marie Company.

## FLAX PULP.

IN the last issue of THE LUMBERMAN reference was made to the proposed establishment of a flax pulp mill at Niagara Falls, N.Y., the process to be adopted being the invention of Mr. F. H. Hickman, of New Jersey. Concerning the process we find the following in the World's Paper Trade Review, of London, Eng.:

It is well known that flax straw as a raw material differs essentially from wood and the straw of other fibrous plants, such, for example, as jute and hemp. The fats and waxes of the flax plant are far more difficult to break down and saponify with a caustic alkali solution than are those of wood, and the percentage of fats and waxes in flax is much higher than in other fibrous plants. Hence, it is necessary to provide a solution for flax which will efficiently break down and eliminate this unusual quantity of fats and waxes, and which can overcome their peculiarly refractory character without destroying or weakening the fibre.

The invenfor says it has been found, in a long course of experiments, that by combining a proper percentage of sulphur with an aqueous solution of caustic soda, the former unites with or saponifies the more refractory fats and waxes of flax and retards the oxidizing effect of the caustic alkali, and thus the process of saponification is so far modified and hastened under proper conditions of time, temperature and pressure, that the fibrous material is protected from injury by oxidation, and the encrusting matter, such as lignin, fats, waxes and gums, is broken down before the fibrous and cellulosic tissue can be

attacked and weakened by the alkali. The percentage of fats and waxes in the flax plant varies under different conditions of soil and maturity, consequently the percentage of sulphur necessary in the caustic liquor varies accordingly. While, however, the proper proportions of ingredients are thus variable within the range of say ½ per cent. to 5 per cent. by weight of sulphur with 99½ to 95 per cent. by weight of caustic soda, the proportions said to be generally found most satisfactory are about 2 per cent. of sulphur to 98 per cent. of caustic soda. It may be said, however, that an excess of sulphur has no deleterious effect upon the product. The liquor is prepared by boiling the sulphur in the caustic soda solution in which it is readily dissolved. In carrying out the process the material is treated with the liquor in a suitable digester under a pressure of preferably 70 to 95 pounds per square inch, with a corresponding temperature for about 4½ hours. The conditions of temperature, pressure and time may, however, be interchangeably varied without affecting the desired result. For the purpose of cheapening the liquor sometimes sodium sulphate has been used as a partial substitute for the caustic soda.

While the flax-plant can be utilised in its pristine condition, that is to say, as it is gathered from the fields, it is advantageous to break it beforehand by machinery, as in the well known process for making upholsterer's tow. This process can also be employed with complete efficiency for the elimination of the objectionable matters frequently found in manufactured flax products, such as yarn or linen fabrics of the lower qualities, their value and utility being thus greatly enhanced.

It is pointed out by Mr. Hickman that the process differs from retting, which only partially removes the gum from the fibre, and only a small percentage of its contained fats and waxes, whilst it destroys all cellulosic tissue other than the bast fibre. It also differs from the bi-sulphite of lime process in being a saponification process, which the bi-sulphite process obviously is not. It also differs from all other saponification processes by reason of the presence in the reducing liquor of sulphur in such form as to be available for union with the fatty constituents distinguishing this pulp, the saponification being thus so far promoted as to make its completion possible before the bast fibres and other cellulosic tissue are injured, a result not attained by the treatment of this pulp material with any other liquor.

## PULP NOTES.

A paper import agency is about to be opened at Shanghai, China, under the title of Ostasiatischen Lloyd.

Mr. F. P. Buck, of Sherbrooke, Que., has been appointed general manager of the Royal Paper Mills Company, East Angus, Que.

On October 16th the ratepayers of Woodstock, N.B., voted in favor of granting a bonus of $50,000 for the establishment of a pulp mill.

Negotiations are still in progress for the purchase by an American syndicate of the Gilmour & Hughson water power at Ironsides, with a view to the erection of a large pulp mill.

Mr. A. J. Morrill, of Nicolet Falls, Que., is considering the erection of a pulp mill on his water power. The electors of Shipton will vote on a by-law to grant him a loan of $10,000 for the purpose.

Mr. Robert Daw, who was connected with the Wilson paper mills at Lachute, Que., for six years, has become manager of the Ottawa Paper Co.'s mill at Ottawa. This mill will turn out 60 tons of paper per week.

It is reported that Mr. J. E. S. Trelawney, of the Anglo-Canadian Syndicate, is negotiating for the purchase of a water power at Bryson, Que., with the object of supplying electrical power and the erection of a pulp mill.

Ground wood pulp is worth nearly 50 per cent. more than it was a few months ago, says the Paper Mill. Sulphite is scarce and costly, and soda pulp commands almost any price the manufacturer cares to name.

The Bertrams, Limited, of London, England, furnished a pulp machine for the Cushing Sulphite Fibre Co.'s mills at St. John, N. B. It has a width of 158 inches, with 25 four-foot dryers, pulp cutting apparatus, etc.

The new dam built last summer at Greenfield, N.S., by T. G. McMullen, M. P. P., was swept away by a recent flood, at a loss of over $15,000. This has retarded the erection of his proposed pulp mill at that place.

A correspondent of the Paper Trade Journal states that Mr. C. W. Roberts has introduced a new style of wood pulp grinder. The invention has been tested by Mr. F. W. Roberts, of the Roberts Grinder Company, of Rondont, N.Y., at the Maxwell pulp mill. It is claimed that an entirely new system for grinding pulp wood has been inaugurated, and that the pulp produced has four times the strength of the ordinary ground wood.

The Dufferin Falls Lumber, Pulp & Paper Co., of Montreal, has been granted provincial incorporation, with capital of $1,000,000. Among the promoters are Wm. Currie, paper manufacturer, and J. T. Shearer, lumber merchant, of Montreal.

Mr. Chas. Phillips, proprietor of S. C. Phillips Co.'s publications, London, England, has been in Canada recently arranging for a visit of leading English publishers to inspect the timber limits and paper manufactories of America. It is expected that the visit will be made next spring.

An important change has been made in the law of Newfoundland affecting pulp wood areas. Hitherto the payment of an initial bounty of $25 per mile entitled the lessee to a lease for twenty-one years, which was renewable. Under the new law the first bounty payable is $5 per year, whereupon a lease will issue for 99 years, subject only to an annual rental of $3 per mile.

A leading publisher of London, England, makes the following statement regarding Canadian pulp: "Many of our paper manufacturers who have used the pulp on a large scale state most emphatically that it is longer and stronger in fibre than the Scandinavian product, and fitted more for making real newspaper for fast running work than any other, and more than one of these gentlemen have stated that they would rather give $2.50 per ton more for the Canadian than any other."

## ONE DOLLAR.

THE above sum represents the yearly subscription price of the CANADA LUMBERMAN, including both weekly and monthly editions, mailed to any address in Canada or the United States. Owing to postal charges, the subscription price to foreign subscribers is two dollars per year. Persons in foreign countries interested in Canadian timber products can invest that sum to no better advantage than by becoming a subscriber. Likewise every mill owner in Canada should read the columns of the CANADA LUMBERMAN. A sample copy will be furnished upon request.

THE BRADSTREET COMPANY gathers information that reflects the financial condition and the controlling circumstances of every seeker of mercantile credit. Its business may be defined as of the merchants, by the merchants, for the merchants. In procuring, verifying and promulgating information, no effort is spared, and no reasonable expense considered too great, that the results may justify its claim as an authority on all matters affecting commercial affairs and mercantile credit. Its offices and connections have been steadily extended, and it furnishes information concerning mercantile persons throughout the civilized world.

Subscriptions are based on the service furnished, and are available only by reputable wholesale, jobbing and manufacturing concerns, and by responsible and worthy financial, fiduciary and business corporations. Specific terms may be obtained by addressing the company at any of its offices. Correspondence invited.

## LUMBER RAFTS FROM BRITISH COLUMBIA.

JAMES ROBERTSON, owner of the patented Robertson rafts, so famous on the Nova Scotian coast, as well as on the Pacific, sailed from Vancouver recently on the Empress of India for the Orient. Mr. Robertson, the Vancouver World says, is on his way to Japan for the purpose of arranging there for the sale of several of the rafts, which are to be built in British Columbia waters near Vancouver, and sent across the Pacific in tow of some tramp steamers.

During his stay in Vancouver, the World remarks, Mr. Robertson made all the necessary arrangements at this end of the line, and now he has gone to Japan to close there for the large lumber contract that he has in hand. This will be the first of the famous lumber rafts to be made in British Columbia, although several of them have during the last two or three years been made on Puget Sound. The rafts were invented quite a number of years ago in Nova Scotia, and the first timber sent by them went to the market along the eastern coast of the States. They were towed by large ocean tugs, and altogether the system has been a complete success. Several of the rafts have been sent from Puget Sound to San Francisco. The last one met with misfortune, but it was later picked up intact and taken to port. It appears from the statement of Mr. Robertson that the hawser between the tugboat and the raft was cut by the seamen, who are opposed to this method of ocean towing, in that it does away with the natural work of loading ships and so on. Another steamer was compelled to spend 20 days in looking up the lost lumber, but after finding it she brought it safely to San Francisco. Mr. Robertson has at the present time another raft building on Puget Sound, but lately he has conceived the idea of taking it across the Pacific, instead of to the south, and has gone over to the other side to make the final arrangements about the deal.

To take one of the rafts across the Pacific will, of course, be the longest tow that was ever attempted, but Mr. Robertson does not think there will be any additional trouble in connection with it.

The last cargo taken to San Francisco consisted of 22,000,000 feet of lumber, the raft being 600 feet long, 40 feet wide and about 25 feet in depth. It is reported that the first one to Japan shall be of about this size, and shaped like a cigar. The principle of construction is that the logs are bound together with steel wire ropes, wrapped around the body of the raft, and through it for the entire length. The raft is made in a cradle, which, in the case of the Seattle raft, cost about $8,000. The raft is built up on the sides higher than in the middle, and then the cables are wrapped around it. The centre is then filled in, and as it does the whole raft settles and the cable becomes tighter all the time. The raft is filled as heavily as possible, and still the cable becomes tighter. The raft is launched and the rolling motion of the sea makes the raft still stronger, and in a short time it is ready for the ocean trip.

## THE MONTREAL, OTTAWA AND GEORGIAN BAY CANAL.

THE accompanying map serves to illustrate the importance to the commercial interests of Canada of the proposed Montreal, Ottawa and Georgian Bay ship canal, a project which bids fair to be carried to completion in the early years of the twentieth century. We are pleased to present also a portait of Mr. McLeod Stewart, the energetic promoter of this magnificent undertaking.

The Montreal, Ottawa and Georgian Bay canal, as the name implies, will extend from the mouth of the French river, on the Georgian Bay, to Montreal, following the course of the French river, Lake Nipissing, Mattawa river and Ottawa river. The total distance is 430 miles, of which 308 miles along the Ottawa river from Montreal to the mouth of the Mattawa is now a navigable channel, requiring but little improvement. The portion of this between Ottawa and Montreal, as shown by solid black line on map, is now a complete waterway, requiring no further improvements. The remaining distance, 122 miles, will consist of the Mattawa and French rivers and Nipissing lake, and, in addition to locks, etc., the construction of about 29 miles of canal will be required. According to the estimates of prominent engineers, the cost of the work will be about $17,000,000, on which two per cent. interest for a period of twenty years has been guaranteed by the Dominion government.

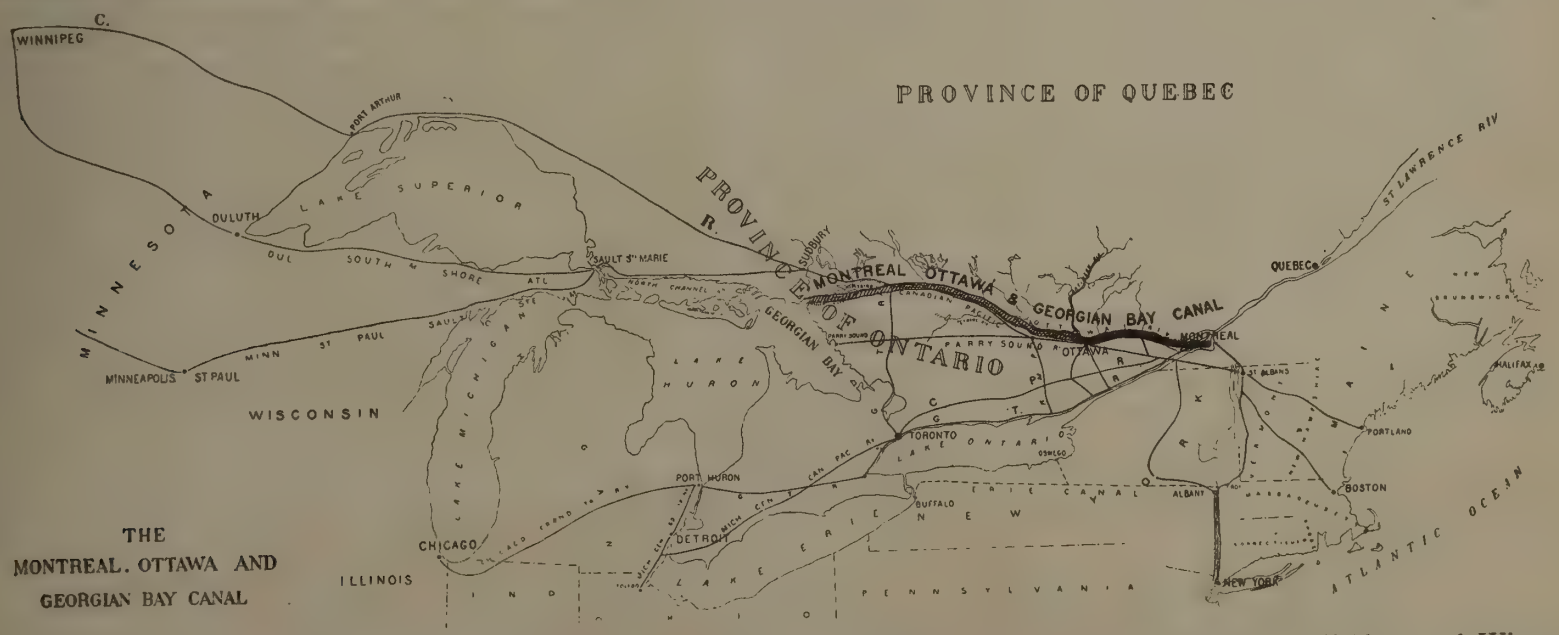
The purpose of this article is not to deal with the financial and engineering features of the canal, but rather to point out briefly some of the advantages which will accrue to Canada and to the lumbering industry of this country by its construction. The development of that section of country surrounding the great lakes has been retarded on account of its inacessibility to ocean navigation. All traffic from the upper lakes must reach tide water via Sault Ste Marie, Lake Huron, Lake Erie, and either the Welland canal, Lake Ontario and the river St. Lawrence to Montreal, or by way of Buffalo, Erie canal, Albany and Hudson river to New York. Both of these routes are very indirect. The proposed Ottawa river route is the shortest practicabl

MR. MCLEOD STEWART,
Promoter of the Montreal, Ottawa and Georgian Bay Canal.

one that can be found from Chicago or any point on Lake Superior, being 307 miles shorter to Montreal than by the Welland and St. Lawrence route, and 435 miles shorter to Montreal than it is to New York by the Erie canal and Hudson river. Thus from Chicago to Montreal via the St. Lawrence the distance is 1,287 miles, and from Chicago to New York via the Erie route 1,415 miles, while from Chicago to Montreal via Ottawa the distance is only 980 miles. The respective distances from Chicago to Liverpool are as follows: Via the Erie canal, 4,505 miles; via Welland canal and St. Lawrence river, 4,087 miles; via Ottawa, 3,780 miles; showing a distance of about 700 miles in favor of the Ottawa route over that of the Erie canal. By means of this shorter distance a saving in time of several days would be effected.

The great lakes, with a coast line of 4,000 miles and an area of 95,000 square miles, afford the largest system of deep water inland navigation on the globe. Vast wealth is already centred in the territory surrounding them, and incalculably rich resources remain still undeveloped. Both in the United States and Canada the greatest development of trade in the future must be in the region tributary to the great lakes, an area of upwards of 2,200,000 square miles, comprising the wheat and timber growing lands of the continent. The natural outlet for those products is through the lakes to the east and tide water. Already an enormous traffic has been developed. From 28,000,000 to 30,000,000 tons of freight are said to pass Detroit annually, and about 18,000,000 tons a year pass through the Sault Ste. Marie canal connecting Lake Superior with Lake Huron. A conservative estimate calculates the traffic by the Ottawa route at the outset at 5,000,000 tons. It has been estimated that wheat can be laid down in Montreal by the Ottawa route at a cost for transportation from Chicago not exceeding three cents per bushel.

It is pointed out that vessels carrying grain eastward will find return cargoes of lumber for lake ports and for distribution throughout Manitoba and the Territories, the route passing through the heart of the richest lumber districts of the continent. Michigan and Wisconsin pine timber is being rapidly exhausted, and a large traffic will be developed along this route from the heavily timbered districts of Northern Ontario and Quebec to Chicago and other lake ports. White pine is said to supply more freight for vessels passing into the St. Lawrence than any other commodity; it employs more capital,



THE MONTREAL. OTTAWA AND GEORGIAN BAY CANAL

and provides more employment for workmen than any industry except agriculture.

The importance of a short waterway to the lumber industry will be enormous. Vast quantities of material now left in the woods owing to cost of transportation will become available for export, and will swell the traffic to much larger proportions without trenching seriously on the supply. The country to be passed through possesses not only a large supply of pine, but also hardwoods, which are being used in increased quantities in the manufacture of furniture, in house finishing, etc. The great spruce tracts will also be opened up, and the development of the pulp industry encouraged.

The lumbermen in Algoma, Nipissing and other northern districts will welcome the completion of the canal. They will thus be enabled to reach their natural market at reasonable carrying charges.

As to the mining properties, we will quote from the prospectus of the company :

" Millions of acres of fertile lands in Northern Ontario now covered with timber will with the advent of cheap transportation fill up with settlers ; and in Algoma, Temiscamingue and Nipissing districts many thousands of people will make homes. Lands now worthless, or held at a nominal figure only, owing to lack of transportation facilities, will at once acquire value approaching nearly to that of lands in the well-settled portions of the province. Mining and smelting operations, the requirements of manufacturing, and of the population will give rise to an ever-increasing demand for coal ; and an important feature of the traffic in the near future will be the carriage of coal from Lake Erie points to points on the system and to French River as a coaling station for vessels engaged in the train trade, with return traffic of lumber and ores from the rich timber and mineral regions along the route ; and probably also the carriage, as a return cargo, of Nova Scotia coal from Montreal to points along the route. Mining is yet in its infancy in the Ottawa country, but researches made up to the present time have shown it to be possessed of incalculable stores of mineral wealth. Within a few miles of the city of Ottawa are immense quantities of iron ore of great richness. The nickel and copper deposits of the Sudbury region are already famous. Several years ago experts who examined the deposits for the United States Navy Department estimated the ore then in sight at 650,000,000 tons, constituting the largest known supply. At many points the Huronian formation, which extends over an area of thousands of square miles, has been found to abound in minerals. Gold, silver-bearing galena, zinc, platinum, tin, molybdenum, graphite, apatite, mica and iron are found, and to some extent already mined. Fine granites, sandstones, roofing-slates, serpentine and dolomitic marbles, etc., are among the non-metallic mineral resources of commercial importance awaiting development ; and the carriage of ores, building-stones, marbles, granites, etc., must in a short time afford the source of considerable revenue to the canals. The four items already mentioned—viz., grain lumber, coal, and ores—constitute almost 90 per cent. of the commerce of the Great Lakes, and the bulk of the traffic of the Ottawa route will no doubt be derived from the same sources."

## EFFECT OF THE CAR SHORTAGE ON THE LUMBER TRADE.

BELOW will be found the opinions of lumber manufacturers and dealers regarding the recent shortage in the supply of freight cars for the movement of lumber. The opinions were offered at the solicitation of the CANADA LUMBERMAN about the middle of October, and are based on individual experiences. Questions were asked as to the extent of the shortage, and whether it was the opinion that other goods had been given precedence over lumber.

IMPERIAL LUMBER CO., Toronto : " We cannot complain seriously of any delay regarding cars."

PEMBROKE LUMBER CO., Pembroke, Ont.: " We have no reason to complain of car supply from the C. P. R., but the Canada Atlantic Ry. has not supplied the demand at all satisfactorily."

ORILLIA EXPORT LUMBER COMPANY, Orillia, Ont.: " We certainly have suffered severely in our business for want of cars. We had orders placed weeks ago that remain unfilled, but cars seem to be more plentiful since the 15th inst."

J. E. MURPHY, Hepworth Station, Ont.: " I had most of my lumber marketed before the scarcity of cars occurred. For what little I have been shipping out, I have been fairly well supplied with cars, leaving no grounds for personal complaint."

J. D. SHIER, Bracebridge, Ont.: " We have, indeed, found the car supply far short of our wants. We have many orders ahead, in fact enough to keep us busy for several weeks. Until lately we do not think other freights got precedence. Now the grain trade is taking all the good box cars. Foreign cars are also scarce."

MICKLE, DYMENT & SON, Barrie : " We have suffered a very heavy loss by the shortage of cars, and in fact have been at nearly a standstill with our shipping. We have only been getting about one-eighth of the cars we need. The G. T. R. have been using the most of their flat cars for hauling gravel for their own use, consequently lumbermen had to go without."

THE GEORGIAN BAY LUMBER COMPANY, Waubaushene, Ont.: " We have been furnished a very fair supply of cars during the season, at times not as many as we desired, but have no complaints to make on that score. Just now box cars are scarce. We presume this is owing to the rush of grain from the west. This will shortly stop, and we will then, possibly, get plenty for lumber."

RHODES, CURRY & CO., Amherst, N. S.: " Cars have been somewhat scarce in the lower provinces for all classes of goods. We think, perhaps, the lumbermen have fared as well as any other shippers. Personally we have had very little trouble about cars, as we are constantly unloading cars coming into us and also building new cars, most of which we have the privilege of loading up again."

JOHN H. EYER, Toronto : " We have not experienced any shortage, this fall, in freight cars, although we have shipped considerably more than in previous years. I attribute the satisfactory supply to the fact that we always have our cars handled smartly and released in good time upon their arrival at destination. We believe the railways keep a record of this and supply cars to those shippers who release their cars the most promptly."

GILMOUR & HUGHSON, Hull, Que.: " We have felt the shortage of cars in the most positive kind of way—an absolute famine. We have orders amounting to hundreds of cars, received in September and not yet shipped. We do not know how it is in other goods, but fancy it to be the same but in a lesser degree. We think there is no doubt the railways have given preference to other business that paid greater freight. And then, too, we think the Canadian railways have had so much business within the country that they would allow no cars to go off their own roads. The American lines knowing this, have refused to send them any cars, when they could get no Canadian cars in exchange. The famine has not been confined to this country ; it has been general over the whole continent. We think it is exaggerated in some parts of Canada."

RAT PORTAGE LUMBER CO., Rat Portage, Ont.: " We have not experienced any serious loss to our trade through a shortage of cars. We are situated on the main line of the C. P. R., about 300 miles west of Lake Superior, and as the C. P. R. have a large number of empty cars moving westward mostly all seasons of the year, they are only too glad to leave them off here to be loaded with lumber to be distributed throughout Manitoba, where they are again loaded up with wheat for Fort William."

HUNTSVILLE LUMBER CO., Huntsvills, Ont.: " There has been a great shortage of cars, more especially flat cars, at this point for a long time. We have been urging the management both at Allandale and Montreal, but with litte effect. We believe that this point being inland has not had a fair show, at least several of the buyers have informed us that they could get cars at any time at Georgian Bay points. We have been behind with our orders to the extent of 150 to 250 cars for some months."

MAITLAND, RIXON & CO., Owen Sound, Ont.: " Re shortage of freight cars to move our stock this season, would say we have up to date had no trouble to get cars, which may be accounted for in this way : A large lake traffic is done through this port, which necessitates the unloading of the large amount of both flat and box cars and leaves plenty available for local shippers. Besides this we have two very accommodating agents here on the C. P. R. and G. T. R., who are always looking after the interests of local shippers."

MASSEY-HARRIS CO., Toronto : " We ourselves have not had any great difficulty so far in securing a supply of cars for our outward shipments. We have had some difficulty in securing supplies of cars for lumber shipments inwards, and our inspectors have sometimes been obliged to wait a day or two for cars. Up to the present time, however, we have not had much cause for complaint. We understand from coal shippers and iron shippers that they are having great trouble in getting supplies of cars. As to whether a preference is given to other goods over lumber we cannot express any opinion."

OLIVER LUMBER CO., Toronto : " The greatest shortage of cars that we experienced was foreign cars, having to wait sometimes for two or three weeks before we could obtain them. We are not aware whether the railroad companies have given precedence to other commodities over lumber. We have always been of the opinion that the railroad companies paid too much attention to through business to the exclusion of their local customers, and hauled commodities for a good deal less money than they would have made had they looked after their local trade. So far as our experience goes, we have had to refuse orders on account of want of cars."

A. F. BURY AUSTIN, Montreal : " We have never experienced, since we have been in business, such a shortage of freight cars to move our stock of lumber. My belief is that the railway companies have given other goods precedence over lumber. We have not been able to get sufficient cars for our lumber for export, and ocean steamers have been daily leaving this port without half the lumber space being filled which has been bought for lumber. The railways have made a rush for the grain traffic, for which no doubt they get a higher rate than for lumber. Again, the railway companies have been doing a good deal of construction work, which has utilized their flat cars, and it has been almost impossible to get a supply of cars to ship our dimension timber. The writer has still some very large contracts to fill for transportation, but we are at the mercy of the railways. We just have to take an odd car when it is given to us, and now that the lumber companies have had a short supply of cars, naturally a large amount of lumber has to be shipped, but the railways have taken good care to advance freight rates on lumber. We expect the lumber trade to be far better next year, and if we do not get better car service than we got this year, all lumbermen will be placed in a very awkward position. My impression is that the railway companies ought to provide a better car supply to the lumber manufacturers, as the railway companies get a very large revenue from the

lumbermen, and they ought to endeavor to see that they get a good car service. There are lots of stocks of lumber which will have to be wintered which should have been shipped before the close of navigation. Owing to the want of cars it has been impossible to ship the material."

HANBURY MFG. CO., Brandon, Man.: "We have had considerable trouble this fall in securing cars for eastern points for handling our stock, but do not think we have been inconvenienced any more than the grain dealers at this point. We feel that we have received as good attention as the railway companies could possibly give us, considering the great rush of freight to the east. Most of our shipments are westward, and we have not had much trouble in getting cars for these points. We have experienced more trouble from having the cars lying in the yards for want of locomotives. Have known cars to lay in the yard here for nearly a week from that cause."

KEENAN BROS., Owen Sound, Ont. : "While we have been very seriously inconvenienced, and even had orders cancelled on account of inability to make shipment because we could not get cars placed, yet we have no knowledge that the railways have discriminated against lumber, and we do not think they have. From inquiries we have made we have found the G. T. R., for instance, has in the neighborhood of 2,500 cars loaded and waiting for transportation from Montreal, and they have no place to store the contents of these cars, even if it were desirable to do so. In spite of the delay we have experienced, we think that both the C. P. R. and the G. T. R. have done all that was possible to supply the requirements of their patrons. We think the only point that possibly may need investigation is whether they have allowed too many of their cars to be sent west to move the grain from that section of the country, thus making this section of the country stand more than our share of the car famine. Except in this way we do not think there has been any discrimination. But, of course, they consider any old car good enough to carry lumber, and will not furnish a car for lumber if it will carry grain without spilling it along the track."

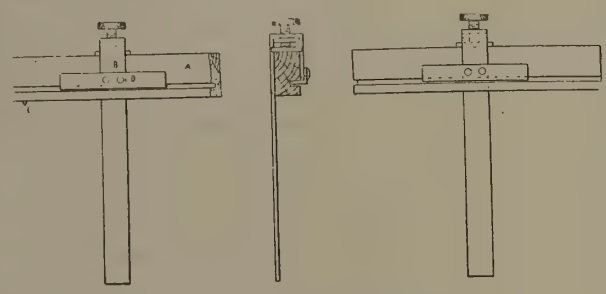
R. LAIDLAW LUMBER CO., Toronto : "The failure of the railways to supply cars this fall has been a serious drawback to our business. For the past three months it has been almost impossible to secure any cars. We have orders for between four hundred and five hundred cars accumulated at the mills, and have had to take our salesmen off the road and refuse to accept further orders on account of our helplessness to fill orders we have. Every mail brings in complaints from our customers of the unfortunate position they have been put in through the want of lumber, for which in many cases contracts have been taken ahead. We could only reply that we were powerless and at the mercy of the railroads. The yards at the mills are overcrowded with lumber ready to ship, and shipping gangs are idle waiting for cars. The effect on the retail trade of the west is disastrous. Building operations have been seriously checked, and in some cases abandoned, on account of the shortage in lumber. A great deal of work that was contemplated has been postponed. One result is that a host of small portable mills are beginning operations in all parts of the west where there is any timber to be secured, and are taking out stocks this fall and winter which can be teamed direct to the retail yards independent of the railways. This will affect the demand on the large mills on the Northern and Midland divisions of the railways when trade opens up next spring. We know of retail concerns in Western Ontario who have contracted for a good part of their stock for next season from small portable saw mills at or near their respective towns, whence they will be sure of their supply and be entirely independent of the railroads. The railroad agents in their official capacity will not give any reason for the car famine in the lumber districts. But, unofficial, it is told that the policy of the railroads is to give their whole attention to competitive business while there is a sufficient rush in that quarter, and to leave all the customers who are entirely dependent upon them to the more convenient season when the boom of prosperity is perhaps on the wane. This is a good money making policy, but whether or not it is a sound business policy is a question. It may have the immediate effect of making a good showing on the stock dividends for a year or so, but surely it is a short sighted manœuvre for any corporation to treat its customers with such utter neglect. The number of our orders is now being gradually reduced, not by shipping, but by our customers instructing us to cancel their orders unless the goods can be shipped by a certain date. As the matter of shipping is beyond our control we must lose these orders and shall lose many others, some of which we probably shall be glad to take again at considerably lower prices. Meantime, the railways have advanced their freight rates and are congratulating themselves that they can at least be sure of their profits on the manufactured stock. In the United States competition keeps the railroads in line. In England a few years ago when the railroads tried to behave as a private monopoly, a railway commission was instituted. This commission has become a permanent body to regulate and control the railways in all matters which pertain to the general public interests and business welfare. What this country needs is a railway commission."

## DOUBLE T-SQUARE.

WRITING in Modern Machinery, Mr. W. G. Garretson says :

I submit herewith a sketch of a double T-square, useful to wood turners on work where there are many pieces to be turned out alike.

The angle iron (D) should be riveted to the blade (B) perfectly square, or when the square is completed and



DOUBLE T-SQUARE.

slipped onto the wooden bar (A) it will belie its name and be a reproach to its maker.

A pin (C) may be inserted near one end to gauge the first line from the end of the work. Several pieces may be laid off at once with this tool, and although marked on one side only, the mark will seem to extend around the piece when revolving in the lathe.

## RAILROAD TIES.

Concluding an article on the relative merits of metal and wood ties, our contemporary, the Pacific Coast Wood and Iron, says :

Substitution of wood for ties has already undergone a great change. Originally the chestnut was considered the finest tree for supplying railroad ties, but forests of chestnuts are scarce in all parts of the country. Oak and pine have both succeeded the chestnut. Of the 80,000,000 ties used for renewals each year, about 45,000,000 are cut from oak trees, 12,500,000 from pines, 3,500,000 from chestnut, 5,000,000 from cedars, 2,500,000 from hemlocks and the tamaracks, 2,500,000 from redwoods, and 1,500,000 from the cypress trees of the south. Thus the oaks furnished about 60 per cent. of all the ties cut annually. The use of the pine trees of the south for railroad ties is rapidly increasing, and when the turpentine or pitch is left in them they last as long as many of the hardwoods. This pitch acts as a natural preservative.

When the ties are cut they have to be piled in neat square heaps according to a system that has been found to give the best results. Careless piling of the ties has cost the railroads thousands of dollars in the past, and now they all insist upon proper piling. This consists in putting not more than 50 ties in a heap, and arranged in a square so that each tier contains from six to nine ties ; separated from each other by a space equal to the width of one tie. The next tier is made up of one tie at each end, placed crosswise, so that the ties are all separated from each other. By this method the wind circulates freely through the piles and causes uniform and slow seasoning.

Railroad ties are both sawn and hewn. The former can be had more cheaply, but the latter last much longer. Some roads claim that the hewn ties will last from one to three years longer than the sawn ties. The rougher surface of the sawn ties collects the water and thus gives the fungus a better opportunity to grow. Nevertheless, the amount of waste of lumber necessary to make the hewn ties often more than counterbalances this difference in the cost.

There is a great diversity in the number of ties used to the mile on the different railroads, as well as in the size and quality of timber. The New York, New Haven and Hartford road use 2,800 ties to the mile, three-quarters of which are chestnut and one quarter oak, while some roads use as few as 2,000 to 2,500 to the mile. Over 60 per cent. of the ties are cut 8 feet long, 12 per cent. 9 feet long, and the rest 8½ feet. The 9-foot ties are used chiefly by the Southern and Gulf group of railroads, where pine timber is very abundant and cheap. The New England roads have their ties cut from 5 to 6 inches in thickness, while the Southern roads seem to prefer 7 inch ties. Tne width of the ties likewise varies from 5 and 6 inches in New England to 8 inches on the Central Northern and the Southern roads.

The tendency to economize on the ties in the east is thus apparent in the size of the sleepers selected, while in the Southern and Western States, where timber is plentiful, there is no such attempt to reduce the width, length and thickness of the ties. The denudation of the forests in the east has made it difficult work for the great railroads to secure all of the ties they require for annual renewal of the roadbed. Most of them have exhausted all of the available timber along the line of the track, and with the exception of a few scattering lots cut by farmers and small wood owners the ties have to be brought from long distances. One of the most important phases of the coast trading business of our lumber ships is the carrying of railroad ties from the woods of Canada to New York and Boston. Cedar ties are now brought in large quantities from New Brunswick and the woods of Maine to New York. This white cedar makes pretty good ties and its abundance makes the ties cheap. The lumber schooners come from New Brunswick by way of the Bay of Chaleur, the great shipping point for cedar ties, and they are dilivered by cargo lots at thirty cents apiece. Hundreds of thousands of the ties are shipped by rail and dilivered to the New York and New England roads at the rate of $12 per thousand feet, board measurement. Besides white cedar ties from the woods of Maine and New Brunswick, there are smaller lots of chestnut, oak, tamarack and hemlock sent down.

The first excelsior machine was a large wheel, called the "Yankee whittler," which cut excelsior very fast, but not the best quality, and was soon discarded for what is called the upright machine. This machine, says the Wood-Worker, has been greatly improved within the last few years. At first one man would cut about 1,600 pounds in ten hours. At present, with the latest improved upright machine, one man will cut from 3,500 to 4,000 pounds in the same time.

THE CANADA LUMBERMAN
WOOD WORKERS' MANUFACTURERS AND MILLERS' GAZETTE

MONTHLY AND WEEKLY EDITIONS

PUBLISHED BY

The C. H. Mortimer Publishing Company of Toronto, Limited

CONFEDERATION LIFE BUILDING, TORONTO

BRANCH OFFICE:
NEW YORK LIFE INSURANCE BUILDING, MONTREAL

The LUMBERMAN Weekly Edition is published every Wednesday, and the Monthly Edition on the 1st day of every month.

TERMS OF SUBSCRIPTION:

One Copy, Weekly and Monthly, One Year, in advance..... $1.00
One Copy, Weekly and Monthly, Six Months, in advance..... .50
Foreign Subscriptions, $2.00 a Year.

ADVERTISING RATES FURNISHED ON APPLICATION

THE CANADA LUMBERMAN is published in the interests of the lumber trade and allied industries throughout the Dominion, being the only representative in Canada of this foremost branch of the commerce of this country. It aims at giving full and timely information on all subjects touching these interests, discussing these topics editorially and inviting free discussion by others.

Special pains are taken to secure the latest and most trustworthy market quotations from various points throughout the world, so as to afford to the trade in Canada information on which it can rely in its operations.

Special correspondents in localities of importance present an accurate report not only of prices and the condition of the market, but also of other matters specially interesting to our readers. But correspondence is not only welcome, but is invited from all who have any information to communicate or subjects to discuss relating to the trade or in any way affecting it. Even when we may not be able to agree with the writers we will give them a fair opportunity for free discussion as the best means of eliciting the truth. Any items of interest are particularly requested, for even if not of great importance individually they contribute to a fund of information from which general results are obtained.

Advertisers will receive careful attention and liberal treatment. We need not point out that for many the CANADA LUMBERMAN, with its special class of readers, is not only an exceptionally good medium for securing publicity, but is indispensable for those who would bring themselves before the notice of that class. Special attention is directed to "WANTED" and "FOR SALE" advertisements, which will be inserted in a conspicuous position at the uniform price of 15 cents per line for each insertion. Announcements of this character will be subject to a discount of 25 per cent. if ordered for four successive issues or longer.

Subscribers will find the small amount they pay for the CANADA LUMBERMAN quite insignificant as compared with its value to them. There is not an individual in the trade, or specially interested in it, who should not be on our list, thus obtaining the present benefit and aiding and encouraging us to render it even more complete.

## THE GRADING OF LUMBER.

THE CANADA LUMBERMAN has always contended that uniform rules of inspection are a great necessity of the lumber trade of this country. It is with much satisfaction, therefore, that we learn of the steps proposed to be taken by the lumbermen of the Ottawa valley to formulate rules for the uniform grading of the product of the mills of that district. It is hoped that the originators of this important movement will receive the hearty support and co-operation of every manufacturer and dealer.

In the Ottawa valley, as elsewhere in Canada, each individual manufacturer has, in the past, made his own inspection. This individual inspection has, we believe, been more nearly uniform in the Ottawa valley than in other lumbering districts of Canada where the mills are more scattered, yet the manufacturers there have at last recognized in a practical way the benefits to be derived from an absolutely uniform standard of inspection. It is only natural to expect that other districts will follow their example, and that the question of national, or, failing this, provincial inspection, for the various timber products will receive consideration in the early years of the twentieth century.

Much has been said regarding the advantages of standard grading. Perhaps the greatest benefits would accrue in connection with our foreign trade. Foreign buyers could then order lumber by grades and know exactly what to expect. Should a dispute arise as to the quality of the lumber, the adopted rules would stand as an authority, and the duty of the courts would be to determine whether the lumber came up to the standard as laid down by the rules.

May uniform rules for both pine ond hardwood lumber soon be established in Canada.

## MEANS OF DEVELOPING THE CANADIAN PULP INDUSTRY.

IN common with all other lines of manufacture, there has developed a shortage in the supply of pulp. The price in Great Britain has been advanced from ten to twenty shillings per ton as compared with last year, and the Scandinavian pulp manufacturers have increased their price for contract for 1900. These facts, coupled with other recent developments, have created a marked revival of interest in the Canadian pulp industry, and a question much discussed is the most efficacious policy to be adopted to assist the development of the industry.

The present policy of the Dominion government permits pulp wood to be exported to the United States free of duty, while the United States government imposes a duty of about $1.66 per ton on mechanical pulp and $6 per ton on chemical pulp exported into that country from Canada. These conditions certainly do not favor the growth of the Canadian pulp industry. The United States is to some extent dependent upon Canada for a supply of pulp wood to keep her pulp mills in operation, and so long as this wood can be obtained free of duty, very little manufactured pulp will be imported; but shut off the supply of pulp wood and the paper manufacturers there must necessarily import pulp from Canada to meet their requirements.

One method of equalizing the conditions would be to place an export duty on pulp wood leaving the Dominion equalling the import duty on pulp imposed by the United States. This is a course which has long been advocated, but which has met with opposition from the farmers and jobbers who take out pulp wood during the winter months and dispose of it to United States concerns. It would not seem, however, that their means of livelihood would in any way be affected by the imposition of an export duty. The only difference would be that the pulp wood which they take out would be manufactured into pulp in Canada instead of in the United States, thus affording employment to Canadian workmen.

Another policy which has many advocates is to bonus home manufacture. The present stumpage dues on pulp wood in New Brunswick amount to about 60 cents per cord, and in Ontario and Quebec to 35 cents per cord. The proposition is to raise the stumpage dues to $3 per cord, and on all wood manufactured in the Dominion allow a rebate of $2.65 per cord. The advantage of this course would be that the Dominion government would not be brought in conflict with the provisions of the Dingley Bill.

It is understood that British capitalists who have been investigating the possibilities of profitably manufacturing pulp in Canada have taken cognizance of the unfair relations which exist as between Canada and the United States, and have held aloof from investment on this account. It is said that they have even caused representation to be made to the United States government looking to the reduction of the duty on pulp and paper. Granting this to be the case, the Dominion government should declare its policy in this importrnt question before the British pulp and paper manufacturers pay their proposed visit to this country next summer. Mr. S. C. Phillips, who has just returned to England after completing arrangements for the visit, states that one object in view is to investigate what the British paper makers are much interested in, namely, the best source of supply of wood pulp. That they are turning their attention to Canada for their supply, which a few years ago was obtained almost exclusively from Scandinavia, is an index of the future importance of the pulp and paper trade of this country.

## SHORTAGE OF CARS.

IN past years freight car shortages have been known, but it is doubtful if ever before the supply of cars was so out of proportion to the stock waiting movement as this year. In nearly every branch of industry this shortage has been experienced; in the lumber trade it has been acutely felt. The commerce of Canada has not alone suffered from this condition; it has extended over the entire continent.

The cause of this general shortage in car supply is, we believe, largely attributable to the rapid expansion of trade within the past two years. Until the early months of 1898 there were few, if any, signs showing that the period of depression was drawing to a close. Towards the middle of that year there was a partial revival of prosperity, which in less than one year culminated in an almost unprecedented improvement in trade. During the period of depression the railroad companies operated their property at small profits, and consequently added to their equipment as little as possible. When a wave of prosperity suddenly swept over the country, they endeavored as far as possible to increase their rolling stock, but the increase was by no means proportional to the augmented quantity of freight created by the opening of factories long idle and the establishment of new industries. A partial car famine was the natural result.

While admitting that the inadequate supply of cars is the result of abnormal conditions not within the control of the railway companies, it would seem that the lumber trade has not been given that consideration by the railway companies to which it is entitled. To some extent lumber has been side-tracked in favor of other commodities. The Canadian railway companies have given precedence to the carrying of grain from the west to Montreal and other eastern shipping ports, and have neglected local shipments of lumber. This has been done in order to get the grain into Montreal and loaded on the vessels before the close of navigation. Local lumber shipments entirely dependent on rail transportation were allowed to wait the convenience of the railway companies, presumably to be moved when the shipment of grain should cease and when there should be less freight to be carried. The local business, it would seem, has been to some extent starved in order that through freight might be accommodated.

What has been the effect of this car shortage upon the lumber trade? This question impresses upon us the serious nature of an insufficient car

supply. The inability of manufacturers to obtain cars for lumber shipments has left lumber in the yards which was contracted for, and which, with ample transportation facilities, could have been sold many times over. Projects intended to be proceeded with this fall have been deferred, and orders for lumber cancelled. Some of this lumber may be carried over, with the consequent incidental expenses, until next spring, and then it may be found necessary to accept a price lower than that at which it was sold this fall, thus entailing a considerable loss to the manufacturer. Another result has been that retail dealers who have been unable to obtain lumber on account of the car shortage are encouraging the starting up of small portable mills in districts where they will be independent of the railways, of course, teaming the lumber to the retail yards. Thus the business of the larger mills will be affected, and there will be less prospect of maintaining prices on a profitable basis.

Observation leads to the conclusion that mills favorably situated have been fairly well supplied with cars; in other words, cars have been supplied only where it suited the convenience of the railways. Other manufacturers, less fortunate, have orders for hundreds of cars of lumber, placed two months ago, which were not shipped by the middle of October, and ocean steamers have left Montreal without half the lumber space being filled that had been contracted for.

It is a peculiar coincidence that since the 15th of October, when an advance on rail freights went into effect, the supply of cars has been much more satisfactory. From this the reader may draw his own conclusions. A situation such as has been encountered this fall emphasizes the necessity of a railway commission to regulate the dealings of the railways with the public.

## EDITORIAL NOTES.

WHEN, we may ask, may the lumbermen expect from the Dominion government an answer to their memorial asking for an import duty on United States lumber coming into Canada? Even if the authorities are not disposed to grant the request, it would be some satisfaction to receive advice to that effect, coupled with the reasons why they consider Canadian lumbermen should not be placed on an equal footing with their competitors to the south.

THE news page of this issue bears evidence of the improved conditions now prevailing throughout the lumber trade of Canada. Encouraged by the increased demand for timber products, manufacturers in every province of the Dominion are taking steps in the direction of increasing their output by erecting new mills or making additions to existing ones. Antiquated machinery is being cast aside, to give place to more modern equipment capable of turning out a better product. Manufacturers of saw mill and wood-working machinery who hope to obtain their share of the benefit resulting from the good times should keep their names prominently before the trade. Do not rely on the motto that when business is brisk advertising is not necessary, otherwise your competitor will reap the cream of the trade, and when business becomes less prosperous, you will find that you have lost ground.

IT is indeed surprising that the lumbermen in the eastern provinces have so long adhered to the axe for the felling of trees. There seems no reason why the saw should not have been as generally adopted for this purpose in the east as it has been in western Canada. There are undoubtedly many advantages in favor of the saw, chief among which is the great saving of timber, a consideration which will become more important as our timber supply becomes reduced. By the use of the saw logs can be cut quicker and at less expense than with the axe, while it also does away with the necessity of experienced choppers. A few of the lumbermen in the eastern provinces some years ago recognized the advantages of the saw over the axe and adopted this method of felling trees, and others are gradually following their example, so that eventually the axe will be entirely superseded by the saw. One result of this will be an increased demand for saws.

## THE ONTARIO TIMBER LAW.

THE hearing of the case brought by the Michigan lumbermen against the Ontario government to test the constitutionality of the provincial law applying the manufacturing clause to all Crown timber lands under license began at Osgoode Hall, Toronto, on November 7th, before Mr. Justice Street, and occupied two days. The proceedings embodied the submission of argument rather than evidence, only one or two witnesses being examined. The Michigan lumbermen were represented by Mr. Christopher Robinson, Q.C., and Mr. H. J. Scott, Q.C., while Mr. S. H. Blake, Q.C., and Mr. Gow were counsel for the Crown.

Mr. Scott, on behalf of the suppliants, opened the case. He said that the petition of right was filed by Mr. Smiley and the Canadian Bank of Commerce, who claimed to be the owners, or licensees, of certain timber lands in the province. Some of these were sold to the licensees in 1872 and the balance in 1885. He contended that the licensees were entitled to the renewal of the license each year in the same form as the old license, with the manufacturing clause omitted. Mr. Scott gave an historical review of the administration of the Crown Lands of Ontario down to the year 1845. In 1845 regulations were passed providing that the licensees should pay certain specified rates for the timber they might cut and should be entitled to a renewal of their licenses, which were issued for one season only, as long as they continued to cut on the limit and otherwise complied with the conditions required. In 1849 regulations were passed providing that timber should be cut at certain specified rates, and there was also a clause stipulating that licensees who duly occupied their limits should be considered as having a preference to renewal above all others. Regulations were adopted in 1851 which superseded the regulations of 1849; under these regulations a ground rent of 2s. 6d. for every superficial mile of timber land was exacted, in addition to the established dues. Thus for the first time was mention made of anything more than a payment for the actual timber cut. A different set of regulations were adopted in 1866, under which timber berths were sold to the highest bidder by public auction at an upset price of $4 per square mile. In 1869 other regulations came into force providing for the exploration of new timber berths and their sale by public auction, the upset price being fixed upon valuation. Mr. Scott reviewed at some length the legislation bearing on the subject passed by the Dominion, Provincial and United States governments, with which our readers are familiar. He contended that if it was held that the Legislature intended to confiscate the property of the Michigan lumbermen, then they maintained that the act was ultra vires; it was clearly an interference with trade and commerce.

Replying to Mr. Scott, Mr. Blake said that the Crown had always reserved to itself the right, as the needs of the country called for it, to make alterations in the law. This was apparent in the case of the increase of rent and in the imposition of higher dues where exportation was intended. While the act of 1849 provided that a license to cut timber might be granted subject to such conditions and regulations as might from time be established, it stipulated that no license should be issued for a longer period than twelve months. Every person who purchased property from the Crown was fully aware of the conditions to which they became subject.

Mr. Aubrey White, Deputy Commissioner of Crown Lands, was examined in respect to the details of his department. He stated that there were approximately 20,000 square miles of timber limits under license. From 1894 to 1898 the output of logs amounted to 715,000,000, of which about one-third was exported.

Mr. John Charlton, M.P., was examined by Mr. Scott. He would not say that the passage of the Ontario law prevented an agreement being reached by the Joint High Commission in regard to lumber, but its effect was certainly prejudicial. Mr. Charlton was questioned regarding the work of the Commission, but his evidence brought out little of interest.

Mr. Robinson then entered upon the argument for the plaintiffs. He said that under the law the licensees were certainly entitled to use their timber berths. Could it be seriously contended that the regulations meant that one year the government could sell a man timber berths and next year take them away from him? He contended that regulation did not include prohibition, but simply meant regulations as to the cutting of timber, and so on. The manufacturing clause applied to future new sales of timber berths and was not retrospective in its operation. He drew attention to the decision of the Privy Council as to what constituted matters of trade and commerce, claiming that the prohibition of the export of saw logs was strictly a matter of trade and commerce, and therefore should be controlled by the Dominion government.

Mr. Blake replied to Mr. Robinson, reminding the court that under the British North America Act the making of laws relating to the management and sale of the public lands and timber lands of the province was relegated to the provincial legislsture. He then laid down the following principles as being correct: (1) A special or particular right of the province cannot be overruled by general and large powers of taxation. (2) Where ground is not claimed and is not entered upon by the Dominion, it will permit the province to go into that ground, although at a subsequent date it may be necessary for the Dominion, by its larger rights, to qualify something which the province has done.

Chief Justice Street reserved judgment.

Since the above was written judgment has been delivered, confirming the action of the government in imposing the manufacturing clause. The full text of the judgment will be found on another page.

## OBITUARY.

The death is announced of Mr. H. Ross, lumber dealer, of Sherbrooke, Que. He had been a sufferer from asthma for some years.

Mr. Adam Shaefer, of Tavistock, Ont., died recently as a result of injuries sustained while operating a rip saw in his planing mill. Deceased was born in Germany in 1845 and emigrated to Canada in 1852, settling on a farm. He learned the trade of a carpenter, and for twenty-eight years was engaged in the furniture business. About five years ago he purchased a saw mill in the Parry Sound district, which he sold last year. He then purchased a furniture factory in Tavistock, which he operated up to the time of his death.

### CHARLES HAMILTON.

Chas. Hamilton, for more than twenty years a prominent lumber operator in the province of New Brunswick, died at St. John early in November, at the age of eighty-five years. Mr. Hamilton retired from active business several years ago, but his only son, James S. Hamilton, owns a large saw mill near the city of St. John. Deceased was born in Sago, Maine, and before removing to St. John was actively engaged in the lumber and pulp business in that state.

### HON. RALPH A. LOVELAND.

Hon. Ralph A. Loveland, a conspicuous figure in the white pine lumber industry of Michigan, died in Saginaw on November 9th. Mr. Loveland was born at Westport, N.Y., in the year 1819, and had been connected with the lumber business since 1857, when he formed a partnership with D. L. White and S. W. Barnard under the firm name of White, Loveland & Company, wholesale dealers, with headquarters at Albany, N. Y. Mr. Loveland's health becoming impaired he removed to Janesville, Wis., in 1863, and in 1869 established a lumber yard in Chicago under the firm name of R. A. Loveland & Company. This enterprise was a marked success, but the failure of a large concern which owed the firm considerable money swept away Mr. Loveland's fortune, and in 1876, at the age of fifty-seven, he started out to begin life anew. He purchased a small mill in Montcalm county, Mich., and later some timber lands in Iosco county estimated to cut 150,000,000 feet of timber. The logs from this tract were rafted to a mill on the Saginaw river near the city of East Saginaw. This limit was logged continuously until 1893, since which time the mill has been supplied from pine lands purchased in the Georgian Bay district of Ontario.

Mr. Loveland, in 1881, organized the Saginaw Lumber & Salt Co., whose annunl output has been 30,000,000 feet of lumber and 50,000 barrels of salt. Mr. Loveland was also a member of the firm of Loveland, Roys & White, which purchased a large tract of pine lands in the Parry Sound district, where board timber for the Quebec market was taken out. Of late years they have taken out a considerable quantity of logs which have been manufactured in lumber at Midland, Ont., under the superintendence of Mr. D. L. White, jr. Deceased was also interested in the Michigan Log Towing Company, as well as several other important enterprises.

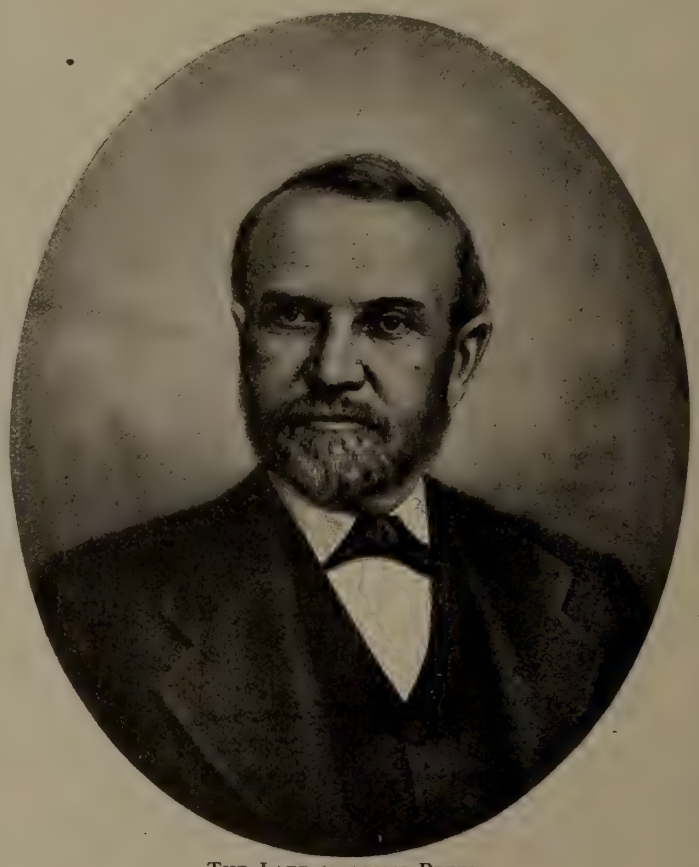
### WILLIAM PETER.

Before the last issue of THE LUMBERMAN had reached the reader, news was to hand of the death of Mr. Wm. Peter, who, through his operations in the Georgian Bay district, had become prominent in Ontario lumber circles. Mr. Peter's death took place at his home in Columbiaville, Mich.

From the American Lumberman we learn that Mr. Peter was born at Bavaria, Germany, in the year 1824, and as a young man came to America as an emigrant. After working on a farm for a time he, in 1851, took up his residence at Columbiaville, Mich., then a little saw mill hamlet on the Flint river, where he has resided ever since. He was employed as a laborer around the little Mulay saw mill at the point, which had a daily capacity of 3,000 feet, but within a month was advanced to the position of sawyer. Shortly afterwards a rise in the river swept the dam away and the mill was shut down for want of power. Here came about Mr. Peter's first business opportunity. In the stream above the broken dam of the mill were left stranded a considerable quantity of large logs intended for sawing. These he purchased with such capital as had been accumulated. He contracted to repair the dam, and then employed the mill owners to cut his logs. The lumber was hauled by team to the Saginaw river 30 miles away. On this venture he cleared about $1,900, and this speculation was the foundation for the big fortune which rewarded his subsequent efforts. For many years following Mr. Peter invested every dollar of his savings in white pine timber lands. He became one of the largest operators in Michigan and held that position for many years. In the year 1860 he established a saw mill at Bay City, Mich., by which he produced many million feet of lumber. He became the owner of timber tracts in Wisconsin, but these he sold without operating on them.

Recently Mr. Peter's holdings of white pine timber in Michigan have become exhausted, and anticipating this, some years ago he purchased the timber limits of the Midland and North Shore Lumber Company in the Georgian Bay district, comprising 212 square miles, together with the saw mill of the company situated at Parry Sound. He at once set to work to make improvements, and put in a double band mill with a daily capacity of 100,000 feet. He has since operated his mill there every season, notwithstanding the very general depression in the lumber trade, which resulted in the closing down of many mills. Mr. Peter was one of the first Michigan lumbermen to secure a mill on the Canadian side of Lake Huron, and his establishment has been a great benefit to the town of Parry Sound.

As Mr. Peter accumulated wealth, he invested it for the



THE LATE WILLIAM PETER.

development and industrial advancement of the country. In his native village of Columbiaville he built a large woollen mill, and nearby conducted an extensive farm. At Toledo, Ohio, he had large and comprehensive interests, including a wholesale distributing yard and door, sash and blind factory, and he was the sole capitalist in the Union Manufacturing Company, producers of sewing machines and woodenware. He was also connected wtih the leading national bank in Bay City.

Mr. Peter was a modest man, very retired, steadfast, and a loyal friend. He left an estate estimated at $1,200,000. Of this he willed $10,000 to his son Alvin Peter, of Toledo, who in late years has had much to do with the management of his business affiairs, and a like amount to his daughter, the remainder being bequeathed to his widow.

---

The property of Young Bros., at St. Margaret's Bay, N. S., consisting of saw mills and 80,000 acres of timber land, has been purchased by Peter Ryan, of Toronto, who is understood to be acting for Michigan and Chicago capitalists. The consideration was $300,000. The purchasers will continue the lumber operations, and will also engage in the manufacture of pulp. A large pulp mill will be erected and additions made to the saw mill, at an expenditure of several hundred thousand dollars.

## OTTAWA VALLEY NEWS.

A MEETING of the leading mill owners of the Ottawa valley was held early in November at the office of the Hull Lumber Company to talk over the question of establishing a uniform standard of grades for lumber. The companies represented included the Hull Lumber Company, Hawkesbury Lumber Company, W. C. Edwards & Company, Gilmour & Hughson, and J. R. Booth. The feeling seemed to be in favor of taking some action, and at a meeting of the Wholesale and Retail Lumber Merchants Association held at a later date the question was further discussed. At this latter meeting there were present representatives of Davidson & Thackray, W. C. Edwards & Company, Hurdman & Elmitt, W. H. McAuliffe, D. O'Connor, jr., S. R. Poulin, Fraser & Hamilton, J. McLaughlin, and others. The question of forming a lumber board of trade for the Ottawa valley was also considered. The officers of the Wholesale and Retail Lumber Merchants' Association are: James Davidson, president; Cecil Bethune, secretary; G. I. Dewar, treasurer.

Speaking of the proposed sale of timber limits to be held by the Ontario government, Mr. Alex. Lumsden, M.P.P., who is interested in the lumber business, stated that the public are not apt to take into consideration the large number of mining prospectors in the country, who would just as soon see a country cleared of its timber, as it would then be more advantageous for the prosecution of their work. He also points out that no government can guard the limits from fire as effectively as private owners can. This was not a reflection on the Crown Lands Department of Ontario, for in no department are the officials so assiduous in the faithful performance of their duty, but it just shows that the public are less afraid of prosecution by the government for any damage done than by private limit owners. Mr. Lumsden is inclined to think that under the circumstances the proposed sale is justified and will prove beneficial to the province.

Judgment has been handed down in the Court of Appeal at Toronto in the case of Hurdman vs. Whyte, reversing the finding of Judge Rose, which was in favor of Whyte. The action was for a declaration that a certain agreement between plaintiffs and defendants in regard to timber limits in the Ottawa valley owned by plaintiffs and advances of money made by defendants were in the nature of a mortgage of such limits by plaintiffs to defendants, and for leave to redeem and other relief. The judgment of Justice Rose declared that upon the fulfilment of certain conditions the plaintiffs would be entitled to immediate possession of a one-fifth share of the property, and directed a reference to take certain accounts if the plaintiffs so desired it. The Court agreed with the holding of the presiding judge that the agreement was not in the nature of a mortgage, but directed a variation of the judgment.

Large gangs of men have been sent to the lumber districts of the Ottawa valley this fall, Messrs. Chitty & Company having supplied most of them. The number of shanties on the various rivers and limits is much greater than it was last season. On the Coulonge there are at least twelve more shanties, while the Black river and other streams each have almost as great an increase. Limits are being worked along the Black river which have scarcely been touched heretofore.

It is reported that 200,000 logs are hung up in the Dumoine river.

The value of sawdust in the Ottawa valley has lately advanced, owing to its more general use as a fuel. The manager of the Hotel Cecil was among the first to start burning the sawdust, and now his hotel is being heated altogether with that product. He pays $1.25 per load of 248 cubic feet. The largest consumers of sawdust in the district are the E. B. Eddy Company. It is said that since they started burning sawdust their fuel bill has been decreased $10,000 a year.

---

## REORGANIZATION OF THE SNOWBALL BUSIINESS.

HON. Senator Snowball is about to make an important change in the lumbering, mill and general business which he established at Chatham, N.B., thirty-five years ago. The business will in future be known as the J. B. Snowball Company, Limited, of Chatham, for which incorporation has been asked. The incorporators are: Hon. J. B. Snowball, W. B. Snowball and R. A. Snowball, of Chatham; F. P. Thompson, of Fredericton, and Geo. E. Fisher, of Chatham. The capital stock is $1,000,000, of which $800,000 is paid up.

# Ontario Timber Legislation Sustained

## Justice Street Dismisses the Action of the Michigan Lumbermen Against the Ontario Government.—The Passing of the Manufacturing Clause Within the Powers of the Provincial Legislature.—Applicable to Limits Sold Before Its Enactment.—Full Text of the Judgment in the Case of Smylie vs. The Queen.

IN the Trial Court at Osgoode Hall, Toronto, judgment was given a few days ago by Mr. Justice Street in the important case of Smylie vs. The Queen, which was an action brought by certain Michigan lumbermen against the Ontario government to compel the renewal of their licenses without the insertion of the clause requiring logs to be sawn within the province, and to obtain damages for the loss sustained through the refusal of that right. The judgment is very strong, and was based on a strict interpretation of the statutes defining the powers of the government in issuing licenses to cut timber of limits that have been sold. The important points established by the judgment are, briefly, that the manufacturing clause applies alike to limits sold before and after its enactment, that the Act is not a breach of contract, and that it is not ultra vires of the Ontario government.

In their first legal fight with the Ontario government the Michigan lumbermen have been defeated, but the case will doubtless be taken to the Judicial Committee of the Imperial Privy Council for a final decision. What this decision will be must remain unknown until judgment has been delivered, but the decision of Mr. Street, and his thorough review of the case and of the arguments presented by the able counsel, cannot but have some influence upon the final result.

The counsel were Christopher Robinson, Q.C., and H. J. Scott, Q.C., for the supplicants, and S. H. Blake, Q.C., and Walter Gow for the Crown. Following is the full text of the judgment :

The rights claimed by the suppliants have their origin in three licenses to cut timber upon certain public lands of the province, the first bearing date on the 10th April, 1873, and the other two on the 2nd October, 1888, issued by the Commissioner of Crown Lands for the Province of Ontario, acting under the authority of certain statutes and orders in council.

The statute in force at the date of the first of these licenses was chapter 23 of the Consolidated Statutes of Canada, entitled "An Act Respecting the Sale and Management of Timber on Public Lands." This Act was a re-enactment and consolidation of an Act passed in the same language by the Parliament of Canada in 1849, being chapter 30 of 12 Vict., which was the origin of the legislation upon the subject, and which has held its place in its original form and substance in the various revisions and consolidations of the statutes of the province down to the present time. Prior to the passing of the statute of 1849 the sales of Crown timber had been regulated by proclamation of the governor-general and by orders in council passed from time to time.

The sections of chapter 23, C. S. C., bearing upon the claim of the suppliants, are as follows :

Sec. 1.—The Commissioner of Crown Lands, or any officer or agent under him authorized to that effect, may grant licenses to cut timber on the ungranted lands of the Crown, at such rates, and subject to such conditions, regulations, and restrictions as may from time to time be established by the governer in council, and of which notice shall be given in the Canada Gazette.

Sub-sec. 2.—No licenses shall be granted for a longer period than twelve months from the date thereof.

Sec. 2.—The said licenses shall describe the lands upon which the timber may be cut, and shall confer for the time being upon the nominee the right to take and keep exclusive possession of the lands so described subject to such regulations and restrictions as may be established ; and such licenses shall vest in the holders thereof all rights of property whatsoever in all trees, timber, and lumber cut within the limits of the license thereef.

Regulations under the authority of the first section of this Act have been from time to time approved, altered, and amended. Those in force at the date of the first of the three licenses in question were passed in 1869, and they remained in force with no material alteration at the time the other two licenses were issued. They are, in fact, in force at the present time, with certain amendments, to which it is necessary hereafter to refer.

The order-in-council of 1869 describes the regulations in question as being sanctioned and established under cap. 23, C.S.C. Those material to the present controversy are as follows :

3rd. The berths or limits when surveyed and set off shall be explored and valued, and then offered for sale by public auction, at the upset price fixed by such valuation, at such time and place and on such conditions and by such officer as the Commissioner of Crown Lands shall direct by public notice for that purpose, and shall be sold to the highest bidder for cash at the time of sale.

5th.—License holders who shall have complied with all existing regulations shall be entitled to have their licenses renewed on application to the Commissioner of Crown Lands, or to such local agent as he may appoint for that purpose.

11th.—All timber licenses are to expire on the 30th April next after the date thereof, and all renewals are to be supplied for and issued before the 1st July following the expiration of the last preceding license, in default whereof the right to renewal shall cease and the berth or berths shall be treated as forfeited.

12th.—No renewal of any license shall be granted unless or until the ground rent and all costs of survey and all dues to the Crown on timber, saw logs, or other lumber, cut under and by virtue of any license other than the last preceding, shall first have been paid.

13th.—All timber, berths or limits shall be subject to an annual ground rent of $2 per square mile, payable in advance before the issuing of any original license or renewal.

14th.—All timber, saw logs, wood, or other lumber cut under any license now in force, or under any license which may be hereafter granted, shall be subject to the payment of the following Crown dues, that is to say :—

(Then follows a table of dues per cubic foot, payable upon the cutting of the various classes of logs and timber.)

24th.—Licenses are to be granted in the annexed form, in duplicate, one of which shall be given to the licensee, and the other kept on fyle at the Crown Lands Department. (Then follows a form of license, being that in which the license granted James Wilkinson on the 10th April, 1873, set out below, was issued.)

Pursuant to the statute and regulations, an auction sale was held at Toronto on the 15th October, 1872, of timber berths, under the authority of the Commissioner of Crown Lands. In the advertisement of the sale, as well as the printed conditions for the guidance of purchasers, it is set forth that licenses for berths sold will be issued one month after date of sale and payment of bonus and ground rent for current season, subject to existing Crown timber regulations, and to such regulations as may hereafter be established by order in council, and also to all orders in council now existing or hereafter to be adopted affecting licensed territory.

The first of the three licenses forming the foundation of the claim of the suppliants was issued on the 10th April, 1873, to one James Wilkinson, who had become the highest bidder at the sale of 15th October, 1872, of the timber berth or location referred to. The license so issued is in the following terms :

By the authority of chapter 23 of the Consolidated Statutes of Canada, 34th Victoria, chapter 19 of the Statutes of Ontario, and the Crown timber regulations dated the 16th day of April, 1869, and for and in consideration of the payments made and to be made to Her Majesty,

I do hereby give unto James Wilkinson, of the town of Barrie, Esquire, and unto his agents and workmen, full power and license to cut every description of timber and saw logs on unlocated and unsold lands or lots, and all pine trees on lots sold or located, under the orders in council of the 27th of May, 1869, or patented as mining lands under the general Mining Act of 1869, upon the location described on the back hereof by number, and to hold and occupy the said location to the exclusion of all others, except as hereinafter mentioned, from 22nd January, 1873, to 30th April, 1873, and no longer, with the right of conveying away the said timber through any ungranted or waste lands of the Crown.

And by virtue of this license, the said licensee has right by the said provincial statute to all timber cut by others during the term of this license in trespass on the ground hereby assigned, with full power to seize and recover the same anywhere within this province.

But this license is subject to the following conditions, viz: That nothing herein shall prevent any person or persons from taking standing timber of any kind to be used for the making of roads or bridges or for public works, the authority of the Department having first been obtained.

And that persons settling under lawful authority or title within the location hereby licensed shall not in any way be interrupted in clearing and cultivation by the said licensee, or any one acting for him or by his permission.

And further, under the condition that the said licensee or his representatives shall comply with all regulations that are or may be established by order in council, and shall submit all timber, saw logs, or other lumber cut under this license to be counted or measured, and settle for the duties chargeable thereon, when required by me or any officer thereunto authorized, otherwise the said timber will be forfeited to the Crown, and the said licensee be subject to such other penalties as the act provides.

Given under my hand, at Toronto, the tenth day of April, in the year of our Lord one thousand eight hundred and seventy-three, in duplicate.

Assistant Commissioner.

(DESCRIPTION.)

This license not to interfere with prior licenses.

This license is subject to order-in-council of 19th April, 1872, authorizing the withdrawal at any time of any lot or lots, or portion of land, included in any license, when such withdrawal is deemed expedient in the interest of settlement.

On 27th April, 1885, an order-in-council was passed by which the Commissioner of Crown Lands was authorized at any time during the currency of the timber license to cancel the right under such license to cut timber other than pine upon any lots included in it which had been sold or located subsequent to the date of such license, or which might have been squatted upon with the bona fide intention of location or purchase, and that all timber licenses which might hereafter be issued should contain a condition in accordance with the above.

By another order in council of 27th April, 1887, the ground rent upon all licenses to cut timber thereafter issued was increased from $2 to $3 per square mile, and the Crown dues upon pine timber and saw logs were increased from the rate fixed by the regulations of 1869.

By another order in council passed 11th March, 1896, the right of license holders to cut timber upon certain lands granted to purchasers after the date of the original license was restricted to four years from the date of the patent.

Turning now to the other two licenses to which the suppliants claim, it appears that the timber berths covered by them were sold by auction in October, 1885, and that the first licenses issued to the purchasers were dated on 2nd October, 1888. Each license was in the following words, the description of the location indorsed upon them and the amount of the bonus constituting the only difference between them :

By authority of chapter 26 of the Revised Statutes of Ontario and the Crown timber regulations dated the 16th day of April, 1869, and for and in consideration of the payments made and to be made to Her Majesty,

I do hereby give unto Burton and Brother, and unto their agents or workmen, full power and license to cut every description of timber on lands or lots unlocated and unsold at the date of this license (or sold or located during the time this license is in force), and pine trees on lands or lots sold under orders in council of 27th May, 1869, or sold or located under the Free Grants and Homesteads Act of 1868, or amendment of the said Act by chapter 4 of the statutes of Ontario of 1880, and pine and cedar trees, when reserved, on lots sold under order in council of 3rd April, 1880, prior to the date of this license, and pine trees on lots patented under said chapter 4, or patented as mining lands under the General Mining Act of 1869, upon the location described on the back hereof by berth and road allowance, and to hold and occupy the said location to the exclusion of all others, except as hereinafter mentioned, from 2nd of October, 1888, to 30th of April, 1889, and no longer ; with the right of conveying away the said timber through any ungranted, uncleared or waste lands of the Crown.

And by virtue of this license, the said licensees have right by the said statute to all timber cut by others during the term of this license in trespass on the ground hereby assigned, with full power to seize and recover the same.

But this license is subject to the following conditions, viz.:

To the withdrawal therefrom of lots located or sold under the Free Grants and Homesteads Act of 1868, prior to the passing of chapter 4 of the statutes of Ontario of 1880, and for which patent may be granted on the ground that five years had elapsed from the date of such location and sale, and that the conditions of settlement had been complied with prior to the 30th April preceding the date or issue of the license.

That any person or persons may at all times make and use roads upon and travel over the ground hereby licensed.

That nothing herein shall prevent any person or persons from taking from the ground covered by this license standing timber of any kind (without compensation therefor) to be used for the making of roads or bridges or public works, by or on behalf of the province of Ontario, the authority of the Department of Crown Lands having first been obtained.

That persons settling under lawful authority or title within the location hereby licensed shall not in any way be interrupted in clearing and cultivation by the said licensees, or any one acting for them or by their permission.

That the Commissioner of Crown Lands, under order in council of 27th April, 1885, may at any time during the currency of the license cancel the right to cut timber other than pine upon any lots included in the description in this license which may have been sold or located subsequent to the date hereof, or upon any lots in said description which may have been squatted upon with the bona fide intention of location or purchase.

And further, under condition that the said licensees or their representatives shall comply with all regulations that are or may be established by order in council, and shall submit all the timber, saw logs or other lumber cut under this license to be counted or measured, and settle for the duties chargeable thereon, when required by me or any officer thereunto authorized ; otherwise the said timber will be forfeited to the Crown, and the said licensees be subject to such other penalties as the Act provides.

Given under my hand at Toronto, the second day of October in the year of our Lord one thousand eight hundred and eighty-eight, in duplicate.

Amount payable for the license :—

| | | $20,768 |

(Sgd.) AUBREY WHITE,
Assistant Commissioner.

It is admitted that the three licenses in question have been from time to time renewed by the Commissioner of Crown Lands in the names of the persons who obtained them originally or their transferees, and that each renewal has been framed in accordance with the regulations in force at the time the renewal was issued, and has not been limited only to those in force when the original was issued. The increased ground rent and Crown dues have been exacted in respect to the renewals of the license issued in 1873, and the conditions with regard to the withdrawal of the right to cut upon lots located or sold have been treated as binding upon the holders of that license, as well as upon the holders of licenses issued after they were adopted by the order in council referred to.

On 17th May, 1895, a new form of license was adopted by order in council, and licenses in this form were issued to and acted upon by the suppliants, the Canadian Bank of Commerce, who then, and for some time before, held all three licenses. The following is one of the licenses so issued, the others being precisely similar :

RENEWAL FOR 1897-8 OF LICENSE NO. 150 of 1896-7.

By authority of chapter 28 of the Revised Statutes of Ontario, 1887, and the Crown timber regulations dated the 16th day of April, 1869, (and subsequent orders in council affecting timber), and for and in consideration of payments made and to be made to Her Majesty,

I do hereby give unto the Canadian Bank of Commerce, and unto its agents or workmen, full power and license to cut every description of timber on lands or lots unlocated and unsold at the date of this license, and pine trees on lands or lots sold under orders in council of 27th May, 1869, or sold or located under the Free Grants and Homesteads Act, or patented or leased as mining lands under the mining laws, upon the location described on the back hereof by berth and road allowances, and to hold and occupy the said location to the exclusion of all others, except as hereinafter mentioned, from the 25th of September, 1897 to 30th of April, 1898, and no longer ; with the right of conveying away the said timber through any ungranted, uncleared, or waste lands of the Crown.

And by virtue of this license, the said licensee has right by the said statute to all timber cut by others during the term of this license in trespass on the ground hereby assigned, with full power to seize and recover the same.

But this license is subject to the following conditions, viz. :

To the withdrawal therefrom of lots located or sold under the Free Grants and Homesteads Act of 1868, prior to the passing of chapter 4 of the Statutes of Ontario of 1880, and for which patents may be granted on the ground that five years had elapsed from the date of such location or sale, and that the conditions of settlement had been complied with prior to the 30th April preceding the date or issue of the license.

To the withdrawal therefrom of all lots located or sold during the currency thereof immediately after location or sale as to timber other than pine.

That any person or persons may at all times make and use roads upon and travel over the ground hereby licensed.

That nothing herein shall prevent any person or persons from taking from the ground covered by this license standing timber of any kind (without compensation therefor) to be used for the making of roads or bridges or public works by or on behalf of the Province of Ontario, the authority of the Department of Crown Lands having first been obtained.

That persons settling under lawful authority or title within the location hereby licensed shall not in any way be interrupted in clearing and cultivation by the said licensee, or any one acting for it or by its permission.

That the Commissioner of Crown Lands, under order in council of the 27th April, 1885, may at any time during the currency of this license cancel the right to cut timber other than pine upon any lots included in the description in this license, which may have been squatted upon with the bona fide intention of location or purchase.

And further, under condition that the said licensee or its representatives shall comply with all regulations that are or may be established by order in council, and shall submit all the timber, saw logs or other lumber cut under this license, to be counted or measured, and settle for the duties chargeable thereon, when required by me or any officer thereunto authorized, otherwise the said timber will be forfeited to the Crown, and the said licensee be subject to such other penalties as the Act provides.

Given under my hand at Toronto the twenty-fifth day of September in the year of our Lord one thousand eight hundred and ninety-seven, in duplicate.

(Signed) AUBREY WHITE,
Assistant Commissioner.

On 17th December, 1897, while the three renewals in this form were current, an order in council was passed in the following terms :—

ORDER IN COUNCIL ESTABLISHING, SUBJECT TO THE APPROVAL OF THE LEGISLATURE, CROWN TIMBER REGULATIONS OF 17TH DECEMBER, 1897.

ORDER IN COUNCIL

Approved of by His Honor the Lieutenant-Governor the 17th day of December, A.D. 1897 :

Upon the consideration of the report of the Honorable the Attorney General dated 17th December, 1897, the committee of council advise that the following Crown timber regulations be approved of by Your Honor :

(1) Every license or permit to cut pine timber on the ungranted lands of the Crown, or to cut pine timber reserved to the Crown on lands located, sold, granted, patented, or leased by the Crown, which shall be issued on or after the 30th day of April, 1898, shall contain and be subject to the condition that all pine which may be cut into logs or otherwise under the authority or permission of such license or permit shall, except as hereinafter provided, be manufactured into sawn lumber in Canada, that is to say, into boards, deals, joists, lath, shingles, or other sawn lumber, or into waney board or square or other timber in Canada ; and such conditions shall be kept and observed by the holder or holders of any such license or permit who shall cut or cause to be cut pine trees or timber under the authority thereof, and by any other person or persons who shall cut or cause to be cut any of such pine trees or timber under

### FOR SALE.

MILL AND MILL SITE IN PARRY SOUND District; eight square miles of Pine, Hemlock and Birch Timber; two good Houses; good Stable and Sheds, and Railroad Siding connecting with Grand Trunk Railway. For further particulars, address Box 150, CANADA LUMBERMAN.

## CURRENT TRADE CONDITIONS.

### ONTARIO.

The movement of lumber during the past week has been very heavy. There have been more cars available, and retail dealers are stocking up liberally in anticipation of a steady winter trade. While a falling off in the demand during the next two months may naturally be expected, the conditions which have existed this season are favorable to a considerable trade throughout the winter months. The lumber which has been shipped to provincial points has very largely gone into consumption, so great have been the manufacturing and building requirements. There are also signs that this manufacturing and building activity will continue throughout the winter, but of course in a lesser degree. This being the case, there seems likely to be a fair movement of stock during the winter period. Prices on foreign specifications are slightly higher than they were one year ago.

Since last issue lumber quotations have not changed in the main, although a slight tendency is reported in the direction of still higher prices for the lower grades. Shingle prices also remain unchanged, but a further advance has taken place in the price of pine lath, which is now selling in Toronto on the basis of $3.50 for No. 1. Everybody seems to be looking for lath, and in the face of an almost exhausted supply, prices have continued to soar upwards. The only change in the hardwood market is an advance of about one dollar per thousand in maple.

### QUEBEC AND NEW BRUNSWICK.

The shipping season from the St. Lawrence will close in a few days, only one or two vessels having yet to sail. The lumber business is settling down to a winter basis, the local demand showing a falling off within the past week. Shipments of lumber will be made from New Brunswick and Nova Scotia to the West Indies and South America for some time to come, as there is a large quantity sold and waiting shipment. Spruce laths and cedar shingles for the United States are much enquired for. Quotations of shingles have advanced about five cents, being now $3.25 to $3.30 on Boston rate of freight.

### MANITOBA AND BRITISH COLUMBIA.

Mild weather prevails throughout western Canada, and consequently more outside work is in progress than is usual at this season of the year. Lumber is moving liberally and no complaints of dullness in trade are made. In British Columbia cities building operations are still progressing with considerable activity. The generally higher prices of lumber have induced loggers to advance the price of logs, but if the present conditions in the lumber trade continue manufacturers will not be seriously affected by this step.

### UNITED STATES.

Lumber is not moving as actively as it was a few weeks ago. Nevertheless, there is a steady trade doing. Owing to a decline in freight rates, considerable lumber has been moved of late from Lake Superior points to the eastern market, and dealers will go into the winter with about an average stock of pine. Most of the dealers have a small quantity of the lower grades, but perhaps a larger supply of the better qualities. The greatest demand continues to be for box and barn boards, and it is predicted that grades of these qualities will undergo a further advance during the winter months. Many of the yards will be sold out of these grades early in January. A slight shading of prices of shaky clear, shaky dressing and inch pine common is reported from Buffalo and Tonawanda, but as the stock is becoming reduced it is not expected that this weakening will be permanent.

Spruce lumber shows firmness, and dealers at Boston are holding to prices. It is estimated that the supply of spruce in the hands of manufacturers and wholesalers is less than 50 per cent. of that of one year ago. Spruce clapboards are

showing rather unaccountable signs of weakness, probably due to an increased production.

A falling off in consumptive demand is the only change in the hardwood situation, scarcity of dry stock being about as pronounced as ever. Ash and basswood are leaders in demand, but maple and elm are more plentiful. At Buffalo thick maple sells at from $28 to $30.

FOREIGN.

Taken altogether, the tone of the British timber market is decidedly firm. Cargoes of wood goods are still being received, but the greatest interest centres in contracts for next year's supplies. We have not learned of any contracts of importance being placed with shippers of Canadian lumber, but as a considerable business has been done in Baltic goods, it is quite probable that some contracts have been entered into for Canadian pine and spruce. The contracts placed for White Sea goods represent an advance of from 20 to 30 shillings per standard in comparison with last year's prices. It is not expected, however, that Canadian lumber generally will command a similar advance, but it is quite probable that prices will be higher all round and that spruce in particular will realize comparatively high prices. Spruce and pine deals are now very firm. At a recent sale held in London first quality spruce sold at £8 5s. for 6 ft. 2x7, and at £8 for 6 ft. 2x6. Two lots of 3x9 second spruce sold at £8 15s., and a parcel of first quality Quebec oak, ex Highfield, at £5 to £5 5s. per load. In some Irish ports there is a scarcity of Norway flooring, and it is thought that Quebec flooring will be purchased more freely in the future.

## STOCKS AND PRICES.

The barque Luarca has completed loading lumber at Weymouth, N.S., for Buenos Ayres.

The C. Beck Manufacturing Co., of Penetanguishene, Ont., have over 200 men in the woods getting out logs.

The shingle mill of the Parry Sound Lumber Co. closed down last week, after having cut 11,000,000 shingles during the season.

Chas. Burrill & Co., of Weymouth, N.S., have shipped this season 750,000 feet of lumber that had been on their wharves for three years.

The Newville Lumber Co., of Parrsboro, N.S., are shipping from that port to New York large quantities of pine and spruce lumber and laths.

Log run lumber is quoted at Saginaw, Mich., at from $16 to $25. Box stock is worth $14 to $16, mill culls $12 to $14, and Norway $12 to $18.

It is stated that between seven and ten million feet of logs will be cut along the line of the St. Martin's railway in New Brunswick this winter.

The schooner Etta A. Simpson cleared from St. John, N.B., last week for Barbados, West Indies, with a cargo of lumber, shipped by A. Cushing & Co.

Wm. Peter, of Parry Sound, is this winter taking out 18,000,000 feet of logs, which will be sawn at the Parry Sound mill. The McKinley-Wood Lumber Co., who have a small mill near Parry Sound, expect to saw 2,500,000 feet next season.

The well-known firm of E. D. Davison & Sons, Limited, of Bridgewater, N.S., have finished sawing 15,000,000 feet of pine and spruce. They have shipped about the same quantity, leaving 5,000,000 feet in pile, mostly sold waiting for shipment.

G. Niebergall & Son have purchased from Curry & McGregor, of Windsor, Ont., the timber on the lands of the Walker Estate. There are about 600 acres, and the timber will keep the mills at Camp Palmer busy for the next two years.

The estimate of the proposed cut of logs on the St. Croix river, in Maine, this winter is 40,000,000 feet, as against 25,000,000 feet last winter. The cut on the Penobscot river is estimated at 170,000,000 feet, or 30,000,000 feet more than last year.

The Yale & Columbia Lumber Co., Limited, has been organized, it being a consolidation of all the saw mills of Yale and Kootenay, in British Columbia. R. P. Genelle, of Rossland, is to be manufacturing manager, and Mr. Poupoie financial manager.

Thompson Smith's Sons, of Cheboygan, Mich., have started operation on their limits on Birch Island, Algoma, and will take out a considerable quantity of timber. The logs will be cut on Indian reserve lands and will be taken to Cheboygan for manufacture.

There is likely to be a great scarcity of shingles of every variety this winter. Most of the shingle mills are shut down, and eastern wholesale dealers have unusually light stocks. Sales at Buffalo are being made on the basis of $4 for best 18 inch pine.

A Michigan firm are, it is reported, looking over the timber limits and saw mill of Moore & Macdowall, at Prince Albert, N.W.T., with a view to purchase. This is one of the largest saw mills in the Territories, in connection with which there are valuable spruce limits.

About three weeks ago the Stevens Lumber Co., of Woodstock, N.B., attempted to take down their logs from the Big Machais, where they have been hung up since last spring. There is 5,000,000 feet in the drive. After working several days they were compelled to give up the task. The drive was gotten down as far as Ashland, but is still 60 miles from the mill.

The Herrmann Lumber Company, of New York, have just closed a contract with Armour & Charlebois, of Hull, for the purchase of the cut of hardwood timber at the Wakefield mill of the latter firm. The quantity is about 1,000,000 feet, and the contract price is understood to represent an advance of about 20 per cent. on last year's prices. Bailey Bros., of Aylmer, Que., have also sold to the Herrmann Company large quantities of hardwood timber, chiefly birch, elm, maple and ash.

E. F. Stephenson, Crown Timber Agent at Winnipeg, states that the quantity of lumber cut last season was fully twenty-five per cent. greater than in any previous year. The quantity of logs cut in Northern Minnesota and floated down the Rainy River was 37,000,000 feet, while that cut on the Canadian side was 45,000,000. Of this total of 82,000,000 feet, it is said that 77,000,000 feet has already been disposed of, which leaves an unusually small quantity in the yards. There were cut during the season between Rat Portage and Fort William over 800,000 ties.

## ENQUIRIES FOR WOOD PRODUCTS.

The following were among the enquiries relating to Canadian trade received at the office of the High Commissioner for Canada in London, Eng., during the two weeks ended November 17th :

1. An Irish firm ask for the name of firms who supply wood cut to sizes for boxes.
2. A Liverpool house doing a general importing and exporting trade in produce and manufactures is ready to consider proposals for handling Canadian goods, and wifl act as purchasing or sales agent for one or two good firms.
3. Walnut boards of good quality, and wooden screws, are required in considerable quantities by a London firm.
4. Enquiry is made for firms in Canada who would supply cheap wood mantel-pieces to be sent over in a knock down condition.

Canadian manufacturers may open up correspodence with any of the firms making the above enquiries by addressing a letter to the publishers of the CANADA LUMBERMAN, by whom it will be forwarded. When writing refer to the number of the enquiry.

## BUILT-UP VENEER BOARDS WANTED.

A manufacturing company in Great Britain with an extensive connection are desirous of importing from Canada built-up veneer boards. They use a large quantity of boards of this class, which at present are largely imported from Russia. Manufacturers in a position to supply such are asked to send details as to the capacity of production, price, etc., to the publishers of the "CANADA LUMBERMAN," by whom it will be forwarded to our correspondents.

## THE EASTERN STATES MARKETS.

In the New York market pine mill culls are quoted at $20, although it is said that few sales are being made at this figure. Perhaps $18 would be nearer the actual market price. Comparing this with the price obtainable in recent years, which was $8 to $9 per thousand, an idea may be obtained of the tone of the pine market. Spruce in New York is selling freely, and there are no unsold cargoes on the market. Eastern cargoes of wide stuff sell readily at prices ranging from $20 to $24, with two inch cargoes held at $17 to $19. Cargo lath have lately arrived rather more freely, but the market has absorbed all offerings readily, and is quite steady at $3.10 to $3.15.

From Boston comes the report that practically all of the river mills in the east have been shut down. There is an undercurrent of activity in building circles which promises an active season during the winter months. Lath and shingles are sold ahead of the saws and are very firm in price, but clapboards continue dull. Uppers and selects in pine are a trifle slow, but almost any other grade from a fine common down to mill cull is wanted.

Haines & Co., of Buffalo, have lately received large consignments of white pine shingles from the Georgian Bay, as well as red cedars from the coast.

## THE BARBADOS MARKET.

Of the Barbados lumber market Messrs. Clairmonte, Mann & Co., in their circular dated November 11th, say :

There have been three arrivals with white lumber during the fortnight, all of which have been sold for other markets. The local demand for both white pine and spruce has fallen off, but there will be a better enquiry for the latter about the end of the year. Last local sales were—white pine, $22 for first quality and $17 for second quality ; spruce at $17.50 for first quality, and $13.50 for second quality. The cargo of spruce, ex Maiden City, referred to in our previous reports, has not been sold.

SHINGLES.—Gaspe cedar in supply : we note the importation of 835,000 ex Neva, sales at $8.50. Cedar laying, $2.57 ; spruce laying, $2.40 ; cypress, no late sales, worth $8.50 to $9 for 8 in. hearts, $6.50 for 6 in. saps. Arrivals : October 30th, bark Lizzie Curry, from Hantsport, N. S., with 340 M feet white pine, sold for Trinidad, at $20 net round for first and second quality ; November 2nd, brigt. Ora, from Jordan river, N. S., with 295 M feet white pine, sold for Trinidad, at $21 round for first and second quality ; Nov. 6th, schooner John F. Kranz, from Hantsport, N. S., with 411 M feet white pine, sailed for Demerara ; Nov. 7th, schooner Neva, from Paspebiac, with 835 M long Gaspe cedar shingles, 400 sold at $3.50, remainder stored ; 165 M cedar laying do, sold at $2.56

## BUSINESS NOTES.

G. W. Murray, planing mill, Winnipeg, Man., is said to be offering to compromise.

The Harrison River Mills, Timber & Trading Co., Harrison River, B. C., has been incorporated.

Perron & Desbiens, saw mill, St. Jerome, Que., have dissolved partnership.

R. T. & Wm. Richardson, saw mill owners, Cairngorm, Ont., have dissolved partnership, R. T. Richardson continuing.

Montpetit & Co., planing mill, Coteau Station, Que., are reported to have filed consent of assignment.

### SHIPPING MATTERS.

The str. Merrimac, from Quebec, October 27th, for Belfast, Ireland, with a cargo of deals, is several days overdue, and it is feared that she has become disabled.

Following are the current rates on wood goods from St. John, N.B., to the ports stated, per regular winter steamers: Liverpool, spruce deals, 47s 6d per standard; birch timber, 21s 3d per load. Manchester, spruce deals, 50s per standard; birch timber, 22s 6d per load. London, spruce deals, 50s per standard; birch timber, 22s 6d per load. Glasgow, spruce deals, 52s 6d per standard; birch timber, 22s 6d per load. Belfast, spruce deals, 50s per standard; Dublin, spruce deals, 50s per standard. Birch deals usually pay about 5s per standard more than spruce to all ports.

the authority thereof, and all pine so cut into logs or otherwise shall be manufactured in Canada as aforesaid.

(2) Should any holder of a timber license or permit, or any servant or agent of such holder, or any person acting for him, or under his authority or permission, violate or refuse to keep and observe the condition mentioned in the preceding regulation, then and in such case the license or permit to cut pine timber on the berth, territory, lot or lots, included in the license or permit, and on which or any part of which there was a breach of such regulation or a refusal to observe or keep the same, shall be suspended and held in abeyance and shall not be re-issued, nor shall a new license issue unless and until so directed by the Lieutenant-Governor in Council and then only upon such terms and conditions as the Lieutenant-Governor in Council may impose.

(3.) The Commissioner of Crown Lands, his officers, servants and agents, may do all things necessary to prevent a breach of the aforesaid condition or regulation, and to secure compliance therewith, and may, for such purpose, take, seize, hold and detain all logs so cut as aforesaid, and which it is made to appear to the Commissioner of Crown Lands it is not the intention of the licensee, owner or holder, or person in possession of, to manufacture or cause to be manufactured as aforesaid in Canada, or to dispose of to others who will have the same so manufactured in Canada, until security shall be given to Her Majesty, satisfactory to the Commissioner, that the said condition will be kept and observed, and that such logs will be manufactured in Canada as aforesaid; and, in the event of refusal on the part of the licensee, owner or holder, or person in possession of such logs, to give such security within four weeks after notice of such seizure and demand of security by or on behalf of the Commissioner, then the Commissioner may sell or cause to be sold such logs by public auction after due advertisement to some person or persons who will give such security to Her Majesty as the Commissioner may require that such logs shall be manufactured in Canada. The proceeds of such logs shall, after such sale, and after deducting all expenses of such seizure and sale, and any sum due and owing to Her Majesty for or in respect of any timber dues, trespass dues, ground rent, or on account of the purchase of any timber or timber berths by the owner, licensee, or holder of a permit, or other person who has cut or caused to be cut such logs, or who is the owner or holder of the same, be paid over to the person entitled to the same.

(4.) Provided, nevertheless, that nothing in the preceding regulations which requires pine logs or timber to be manufactured in Canada, as aforesaid, shall apply to logs or timber cut and in use in Canada for any purpose for which logs or timber in the unmanufactured state are or may be used.

(5) Provided further, that these regulations shall not apply to the east half of the township of Aweres, in the district of Algoma, containing 18½ square miles, nor to 22 square miles in the district of Thunder Bay composed of berths 2, 3 and 4 of the timber sale of 1890.

(6) The foregoing regulations shall not come into force unless and until they shall be approved by an Act of the legislature.

On 17th January, 1898, an Act was passed by the legislature of the province of Ontario in the following terms:

91 Vic. (Ont.) Cap. 9, passed 17th January, 1898. An Act respecting the manufacture of pine cut on the Crown Domain.

Her Majesty by and with the advice and consent of the Legislative Assembly of the Province of Ontario, enacts as follows:

(1) All sales of pine timber limits or berths by the Commissioner of Crown Lands which shall be hereafter made, and all licenses or permits to cut pine timber on such limits or berths thereafter granted by the Commissioner shall be so made or granted subject to the condition set out in the first regulation of Schedule A of this Act, and it shall be sufficient if such condition be cited or mentioned as "The Manufacturing Condition" in all notices, licenses, and permits or agreements or other writing.

(2) The regulations set out in Schedule A to this Act are hereby approved.

(3) The Lieutenant-Governor in Council may make any further or additional regulations necessary to enable the Commissioner of Crown Lands to carry into effect the object and intent of the regulations contained in Schedule A.

(4) Section 1 of this Act shall come into force on the passing hereof, and the other parts of this Act shall come into force on the 29th day of April, 1899.

SCHEDULE A.

(Schedule A reproduces the above regulations of 17th December, 1897.)

After the 29th April, 1898, the suppliants applied to the Commissioner of Crown Lands for a renewal for the year 1898-9 of the said licenses without the insertion of the provision in the regulations of 17th December, 1897, referred to in the above Statute as "The Manufacturing Condition," but the Commissioner refused to issue the license without this condition.

It is admitted that the suppliants had complied with all former conditions in the licenses previously issued to them.

Having obtained leave for the purpose they have now filed their petition of right praying for a declaration of their right to a renewal of their licenses without the manufacturing condition, and damages for the loss they have sustained by reason of the refusal of this right.

Their claim, at the argument, was placed upon the ground that they or their predecessors had purchased the right to the timber upon the limits from the Crown upon a contract for perpetual renewal of the yearly license, so long as they should comply with the regulations in force at the time they purchased, and that, in the absence of the clearest provisions to that effect in the writings forming their contract, it would be unreasonable to hold their rights to be subject to alteration from year to year, to their prejudice, by orders-in-council made without their consent.

In my opinion, not only the terms of the original licenses themselves, which, prima facie at all events, must be taken to show the rights of the licensees, but everything surrounding the transaction, before and since, is opposed to the contention of the suppliants.

In the first place, the statute under which the Commissioner of Crown Lands acts is as clear as words can make it; he is empowered to issue licenses, but only upon the terms prescribed from time to time by orders-in-council, and he is forbidden to grant any license for a longer period than a year.

The object of the act is plainly to prevent the government existing at any particular time from binding itself or future governments to abide by any particular regulations in their management of these immensely valuable portions of the public property, lest new circumstances should make it advisable in the public interest that changes should be made. The object of the legislature to permit merely temporary and not permanent regulations to be made being plainly and distinctly set forth in the Act, the language of the orders in council passed under it must be read by the light so furnished, and certainly should not be strained so as to convey an intention of departing from it. The intending purchaser is notified that his license will only be issued "subject to existing Crown timber regulations, and to such regulations as may hereafter be established by order in council, and also to all orders in council now existing or hereafter to be adopted affecting licensed territory. In accordance with this provision, the licenses when issued are made upon condition that the licensees shall comply not only with all regulations that are, but also with those that may be established by order in council. With the licenses are incorporated by reference the regulations of 1869, in force at the time, and it is upon the 5th regulation that the suppliants very largely found their claims. The terms of that regulation are that "license holders who shall have complied with all existing regulations shall be entitled to have their licenses renewed on application to the Commissioner of Crown Lands, &c." If this regulation stood alone, without the Act under which it was made, the conditions of sale at which the purchase was made, and the license, which is to be read with it, there would be the greatest force in the argument that the original licensee was entitled to a perpetual renewal of his license from year to year upon compliance with the regulations in force when it was granted. But the Commissioner of Crown Lands in granting the licenses, has imposed upon the licensees, as he was bound to do by the existing act and regulations, the condition that not only the regulations in force at the time the licenses were granted, but those to be established, should be complied with; and the right of renewal conferred by the 5th regulation of 1869 must be taken to be a right of renewal upon the conditions in force at the time of the renewal. In other words, persons desiring to obtain timber licenses are notified by statute, by conditions of sale, and by the form of license offered them, that they can only obtain them upon the understanding that the conditions upon which they are granted may be altered from time to time at the discretion of the government, and that as their sole protection against wrong, they must rely upon what has been termed "the infallible justice of the Crown" by the late Vice-Chancellor Esten in Craig vs. Templeton, 8 Gr. 483. Such a bargain is by no means remarkable or unknown even in cases where the Crown is not a party; see Pepe v. City and Suburban Building Society (1893), 2 ch. 311, and the class of cases there referred to.

The sentences to which I was referred by counsel occurring in the report of the Commissioner of Crown Lands to the Provincial Legislature in the year 1872 do not appear to establish or assert any different interpretation of the rights of licensees. He asserts that they have vested rights to a renewal of their licenses, but it is plain that he contemplates only such a renewal as that which has always been conceded to them, viz., a renewal subject to the conditions and regulations in force at the time the renewal is granted.

Reference was properly directed upon the argument to the contemporaneous interpretation placed by the executive officers of the Crown upon the regulations affecting the rights of license holders, and the manner in which they have been dealt with from time to time by the Department as bearing upon the meaning which should now be placed upon them. It appears from the evidence of Mr. Aubrey White, the present Assistant Commissioner of Crown Lands, whose experience in the Department goes back many years, that the invariable practice has been to embody in every license, whether an original or a renewal, all changes effected by orders in council in force at its date. This practice is apparent in the renewals of the licenses under which the suppliants claim; they and their predecessors periodically accepted licenses which contained not only the conditions in force at the time of the original licenses, but all these additional ones subsequently adopted, and paid the additional ground rent and Crown dues on timber cut imposed by the regulations of April, 1887.

These considerations appear to me conclusive against the contention of the suppliants that they are entitled to renewals of their licenses free from any conditions, to which they object, coming into force after the original license under which they claim.

It is further argued, however, that, even if this be the true construction to be placed upon their rights, the language of the Act 61 Vic. Ch. 9, above set forth, applies only to licenses issued upon sales made after it was passed, and not to renewals of licenses issued upon sales made before it was passed. Had the first section of the Act stood alone, I think I should have agreed with this view, but the fourth section brings into force on 29th April, 1898, the order-in-council of 17th December, 1897, the first section of which requires what is called in the Act the "Manufacturing Condition" to be made a condition of every license or permit to cut pine timber which should be issued after 30th April, 1898. It is urged that the injustice of interfering with the vested rights of existing licensees obliges the Court to place the strictest possible construction against the Crown upon the Act and the order-in-council as being ex post facto legislation. I do not think, however, that I should, in regard to this legislation, do more than apply to it the ordinary rules of construction. It is not ex post facto legislation; it is a simple application to the undoubted rights of the suppliants of the undoubted rights of the Crown. The rights of the suppliants are to have their licenses renewed according to the conditions which at the time of renewal have been generally imposed upon license holders, and so long as renewals are offered them upon conditions which the Crown, as represented by the Provincial Governor in Council, has the power to impose, no breach of the rights of the suppliants is committed. It is no part of my duty to adjudicate upon the question as to whether the conditions of the order-in-council of December, 1897, are unduly onerous, or to criticize the discretion exercised by the Crown in imposing them. I find here in the order-in-council of 17th December, 1897, a plain and unambiguous direction that every license or permit to cut timber issued on or after 30th April, 1898, shall contain and be subject to what is called in the Act the "Manufacturing Condition," and if this language is not plain enough, I find in the fifth paragraph of the order-in-council internal evidence that it was intended to be applicable to past as well as future sales. To construe it as the suppliants ask, I should have to apply to the word "license," in the first paragraph, the meaning of "original license," and to treat it as not in-

cluding the renewals of existing licenses—a sense in which I cannot find it has ever been used, and which appears to me to be contrary to the spirit as well as the letter of the fundamental Act, chapter 23 of the Consolidated Statutes of Canada.

I cannot pretend to explain why the first section of the Act 61 Vict., Cap. 9, should have been so drawn as to be apparently applicable to future sales only, and not to past ones, but the later and entirely distinct paragraphs 2 and 4 of the same Act bring into force the orders in council of 17th December, 1897, in which, as I have pointed out, there is no ambiguity, and which stand upon their own ground. To hold them applicable to new sales only, and not to renewals also, would be to strain their language for the purpose of introducing an innovation upon the long established and invariable practice of the department.

The remaining ground taken by the suppliants is that the Act 61 Vict., cap. 9, is ultra vires the Provincial Legislature as being an encroachment upon the legislative authority reserved to the Dominion by the British North America Act.

It is declared by the 91st section of that Act that the exclusive legislative authority of the Dominion parliament extends to all matters coming within the classes of subjects there enumerated, the second of which is, "The regulation of trade and commerce," and it is further declared by that section of the Act that any matter coming within any of the classes of subjects therein enumerated shall not be deemed to come within the class of matter of a local or private nature comprised in the enumeration of the classes of subjects assigned by the 92nd section exclusively to the legislatures of provinces.

By the 92nd section, it is declared that in each province the legislature may exclusively make laws in relation to matters coming within the classes of subjects next enumerated; and the 5th of the classes of subjects then enumerated is: "The management and sale of the public lands belonging to the province, and of the timber and wood thereon."

It is proved on the part of the suppliants in support of their contention, that for many years before the passing of the Act complained of (61 Vict., cap. 9) a very large number of pine logs had been exported from Ontario, the larger proportion of which had been cut upon the public lands of the province, under licenses similar to those now in question. It is a matter which may readily be taken for granted that if the regulations in question are sustained, the export of logs cut under such licenses will be entirely stopped. It is further shown that the tariffs established in the United States from time to time with regard to the timber trade with Canada have been affected at times by the tariffs adopted by the Dominion bearing upon Canadian timber, or have been, to some extent, regulated by or been made dependent upon them. I am asked to draw from these circumstances the conclusion that the Act and regulations of which the suppliants are now complaining are a contravention of that part of the British North America Act which reserves to the Dominion Legislature the exclusive right of making laws for the "regulation of trade and commerce," and to hold that the Provincial Legislature under the guise of a regulation for the management of its timber has, in reality, attempted to interfere with the regulations of trade and commerce. In my opinion the Act and regulations complained of are clearly within the powers of the Provincial Legislature, and are not in any way an interference with the regulation of trade and commerce within the meaning of the 91st Section of the British North America Ac.

In the first place, it is to be borne in mind that the Provincial Legislature in passing this Act are dealing with property belonging to the province, over which they have the fullest power of control. They are entitled to sell it or to refuse to sell it, and if they sell, they have the right, in my opinion, to impose upon the purchaser such conditions as they deem proper with regard to the destination of the timber after it is cut, including the state in which it shall be exported, just as they have the right in selling cattle from the farm at their agricultural college to stipulate that the purchaser shall not export them alive. The condition that the timber shall be sawn into lumber before exportation in the one case no doubt reduces the quantity of logs exported just as the supposed stipulation in the other case reduces the quantity of live stock exported, but in each case the matter is one purely of internal regulation and management by she province of its own property for the benefit of its own inhabitants.

The matter, I think, may be placed beyond any question by looking at it in another way. It is clear that the right to pass the Act complained of, and the regulations accompanying it, xettum ist either in the Provincial or the Dominion Legislature, and if the contention of the suppliants is to be adopted, it exists in that of the Dominion. Would it be possible for a moment to contend that the Dominion Legislature under their power of passing Acts for the regulation of trade and commerce, could enact that every license to cut timber upon the lands owned by the province of Ontario should contain a condition that the timber should be sawn into boards before being exported? And would not such an Act, if passed by the Dominion, be clearly an encroachment upon the exclusive right of the Provincial Legislature to pass laws for the regulation and sale of the timber on its own lands? The general limitation upon the powers of the Dominion Legislature to legislate with regard to the regulation of trade and commerce are indicated in the report of the judgment of the Privy Council in the case of the Citizens' Insurance Company of Canada vs. Parsons, 7 App. Cas. 96 at p. 113, where it was held that these powers do not comprehend the power to regulate by legislation the contracts of a particular business or trade, such as the business of fire insurance in a single province, but for the reasons I have given it appears to me that the powers exercised by the legislature of the province of Ontario which are questioned by the suppliants here are so plainly within those exclusively assigned to them that it is unnecessary to resort for guidance to any of the decided cases.

Upon the whole case I am, therefore, of opinion that the suppliants are not entitled to have their licenses renewed except upon the conditions offered by the Commissioner of Crown Lands, as set forth in the orders in council in force on 30th April, 1898, and that their petitions must be dismissed with costs.

## LOSS BY FOREST FIRES.

IN a book entitled "A Primer of Forestry," issued under the direction of Mr. Gifford Pinchot, the author gives an interesting sketch of historic forest fires, from which the following extracts are taken:

"When all conditions are favorable, forest fires sometimes reach gigantic proportions. A few such fires have attained historic importance. One of these is the Miramichi fire of 1825. It began its greatest destruction about 1 o'clock in the afternoon of October 7 of that year, at a place about sixty miles above the town of Newcastle on the Miramichi river in New Brunswick. Before 10 o'clock at night it was twenty miles below Newcastle. In nine hours it had destroyed a belt of forest eighty miles long and twenty-five miles wide. Over more than two and one-half million acres almost every living thing was killed. Even the fish were afterwards found dead in heaps on the river banks. Five hundred and ninety buildings were burned, and a number of towns, including Newcastle, Chatham and Douglastown, were destroyed. One hundred and sixty persons perished, and nearly a thousand head of stock. The loss is estimated at $300,000, not including the value of the timber.

"The Peshtigo fire of October, 1871, was still more severe than the Miramichi. It covered an area of over 2,000 square miles in Wisconsin, and involved a loss, in timber and other property, of many millions of dollars. Between 1,200 and 1,500 persons perished, including nearly half the population of Peshtigo, at that time a town of 2,000 inhabitants. Other fires of about the same time were most destructive in Michigan. A strip about 40 miles wide and 180 miles long, extending across the central part of the state from Lake Michigan to Lake Huron, was devastated. The estimated loss in timber was about 4,000,000,000 feet board measure, and in money over $10,000,000.

"The most destructive fire of more recent years was that which started near Hinckley, Minn., September 1, 1894. While the area burned over was less than in some other great fires, the loss of life and property was very heavy. Hinckley and six other towns were destroyed, about 500 lives were lost, more than 2,000 persons were left destitute, and the estimated loss in property of various kinds was $25,000,000."

## GETTING TIMBER LAND CHEAP.

THE statement of the Division of Forestry of the United States to the effect that the last of the great white pine timber tracts of the Northwest lies in the northern part of Minnesota, a vast region of several thousand square miles, receives additional interest in the light of advices from Duluth that dealers in timber lands are conducting operations under which they are acquiring some of the most valuable timber lands in northern Minnesota for almost nothing, and doing it legitimately, too. They are locating on lands in the northern tier of counties in this State with what is known as forestry scrip, which entitles them to locate on any lands, surveyed or unsurveyed, in any part of the country. This scrip they have been able to buy at $2 to $4 per acre, and thus they have been locating on lands in this and other counties at a cost to them of about the value of one large pine tree out of the hundreds on each acre.

It will be remembered that during President Cleveland's administration he was much interested in the matter of preserving the forests, and a number of large forest reservations were made by him, mostly in the west. On the lands thus reserved there were, of course, a good many settlers, and to compensate them for the loss of their lands they were given this forestry scrip. This could be located on land anywhere in the United States, whether surveyed or not, and it was the first scrip ever issued entitling its holder to locate on unsurveyed lands. Recently a number of land dealers have been west and have purchased a quantity of this scrip from the people to whom it was issued, and returning, they have entered upon the choicest pine lands in the unsurveyed portions of this state. This scheme is working so well that others are taking it up, and the result is that nearly all of the valuable portions of the unsurveyed pine lands will be located long before the territory is surveyed and thrown open to settlement. There is no way to prevent this, as the holders of the scrip are allowed to sell it, and the purchasers acquire the rights of those to whom it was issued. Those who are working the scheme will get immense profits out of it, as they are getting from $2 to $4 per acre land that is easily worth many times that.

It is possible that congress will be appealed to at this winter's session to see if there is any way that body can put a stop to the practice. There seems to be no other way to stop it, and there is considerable doubt whether even that method will stop it, as before any law can go into effect the men who are working the scheme can get hold of large quantities of the scrip and locate the best part of the unsurveyed pine lands of this section. When the unsurveyed lands are thrown open to settlement there will be almost nothing that is worth locating upon left.—Lumber Trade Journal.

Mr. Horace B. Hudson contributes to the Review of Reviews for December an account of the movement to establish a national forest park in Minnesota, near the headwaters of the Mississippi.

## AS WE FIND THINGS.

By A. J. BURTON.

I WISH to call attention to the center strain line in band saws. If any of the filer readers of The Wood-Worker are using this strain line successfully as regards quality and quantity of lumber, at the same time prolonging the life of their saws, I would be pleased to see their experience published in these columns, and am confident a great many others would too. Such discussions must necessarily be beneficial. Life is too short for one man to learn it all by experience.

In taking charge of the saws in the mill where I am at present engaged I found all the saws had been put up with the strain lines as follows: They were solid commencing about one inch from the gullet of teeth and extending over a space of about two inches toward the center, then a space of three inches in the center that was "fast" or

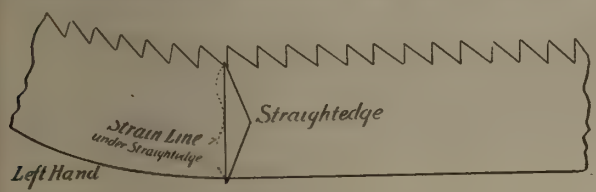

FIG. 1.

stiff, then two inches that had been rolled or opened to the back edge. When the saw was held up with the left hand and a straight edge applied across it three feet from the lelt hand, it would show up like Fig. 1. The saws had from 1 to 17 cracks and some of them two and three brazes. They were 10 inches wide when new, but had worn down to 9¾ inches. Under any kind of reasonable conditions the saws ought not to have had a crack in them.

The only way I can put up a saw that will not crack under favorable conditions, is to put the tension in on a perfect circle from one edge to the other, as shown in Fig. 2. The drop under straight-edge shows the tension. I use a gauge and make every spot in the saw true to gauge, leveling the saw perfectly flat, so that the straight-edge shows no light under it when laid across the saw when it lies flat on the leveling table. The filing room had been provided with

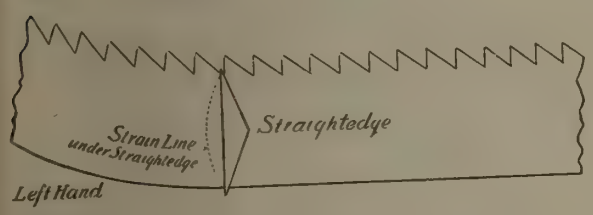

FIG. 2.

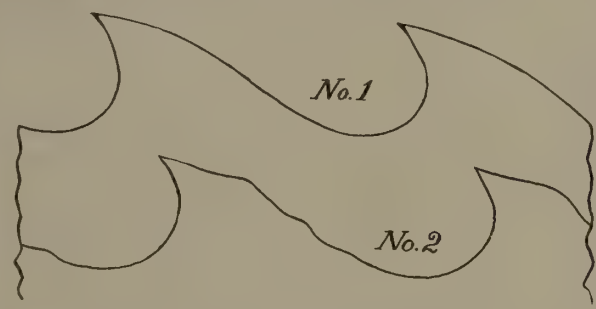
a Baldwin, Tuthill & Bolton No. 5 stretcher, but the top roll had been disconnected and used only as an idle top roll. The rotary shears, also the parts that move the roll back and forth, had been taken off, making the $250 machine practically no better than one which could be bought for $150. I replaced all parts and find the machine works perfectly.

The grinder is one of the most improved Covel make, but the former filer did not consider it accurate enough for him and only used it to gum out with, doing all the filing by hand, which, of course, took lots of time, labor and files. He had post brackets and back feed, but had the grinder setting in the center of the saw as it lay in the post brackets. This allowed the saw to gag over the guide rest in the operation of grinding, which, of course, caused the grinder to do bad work. Besides this the teeth pointed from the light instead of toward it. I turned it around and set the grinder toward one end of the saw, so the saw would rest on one post bracket and on the guide rest only. In this way the saw moves around perfectly in line with its back edge. I also found the small gear on grinder was on the wrong side of machine, which caused the cam shaft and cam to run backwards; and, worst of all, he had a left-hand cam-holder and cam on a right-hand machine. I don't wonder at him filing by hand, and only wonder that he was able to gum his saws. I then undertook to make a right-hand cam-holder out of a left-hand one by plugging up the shaft-hole with hot iron and drilling another hole for the shaft ¾ inch higher, to allow the holder to drop down at the right place, so the wheel would come down in the gullet. Then the cams would not fit, so I filled the hollow side with babbitt, turned them upside down and tapped in new holes for the screws. When I put it on the machine, took out all lost motion, and rebabbitted the machine it started off like an old clock and ground the teeth to a good keen edge without missing a tooth or burning one. No. 1 is the shape of tooth the machine now makes. No. 2 is the shape of teeth in the saws when I came here.—The Wood-Worker.



## BRITISH COLUMBIA LETTER.

(Correspondence of the CANADA LUMBERMAN)

IT is possible to write very encouragingly of the lumbering industry of this province. As the year draws towards a close, manufacturers naturally take a retrospective glance. Until the business of the year has been balanced up, the actual profits and losses will not be known, but it is safe to predict that the year 1899 will pass into history as one of the most successful that the lumbermen of the west have known for some years. It will also mark the putting into operation, after years of idleness, of one or two large mills which will represent a considerable proportion of the lumber cut of the province. To say that the mills are busy does not fully explain the situation. The fact is that orders are being refused owing to inability to supply the lumber at the time the customer requires it.

Just to give an idea of the markets to which British Columbia lumber is shipped, I send a list of the vessels which had cleared up to October 31st of this year:

From Chemainus—John Smith, for Cape Town, South Africa, 626,856 feet; J. B. Brown, for Sydney, Aus., 1,142,728 feet; Coloma, for Tientsin, China, 700,497 feet; W. F. Witzemann, for Tientsin, 364,068 feet; E. K. Wood, for Tientsin, 660,292 feet; Hawaiian Isles, for Melbourne, Aus., 1,914,665 feet; Sea King, for Sydney, Aus., 1,130,378 feet; Orion, for Calcutta, British India, 1,616,318 feet; Undaunted, for Cape Town, 1,263,853 feet; Star of France, for Melbourne, 1,176,922 feet; British General, for Australia, 1,457,539 feet; Hercules, for Queensboro, 907,546 feet; Bastien Bach, for Tientsin, 552,566 feet; King Cyrus, for Newchang, China, 878,728 feet; Guy C. Goss, for Taku, 1,134,648 feet; Nanaimo, for Taku, 419,152 feet; Dalnyvostok, for Port Arthur, China, 1,452,876 feet; Tyr, for Newchang, 1,618,102 feet; E. K. Wood, for Shanghai, 634,372 feet; Echo, for Valparaiso, South America, 877,993 feet; Elwell, for Melbourne, 1,107,433 feet. From Moodyville—Louisiana, for Sydney, 1,128,111 feet; Ragnar, for Newchang, 1,194,421 feet; Rodenbek, for Callao, South America, 1,309,231; Altcai, for Callao, 1,012,013 feet; City of Madras, for Australia, 1,321,177 feet; Dundee, for Calcutta, 1,791,985 feet; Florence, for Sydney, 1,237,959 feet. From Burrard Inlet—Compeer, for Japan, 416,928 feet; Adderley, for Sydney, 1,002,738 feet; Elm Branch, for Tientsin, 2,841,324 feet; Wachusett, for Melbourne, 1,111,240 feet; K. F. Troop, for Philadelphia; Wm. H. Macy, for South Africa; Ivy, for Shanghai; Tyr, for Newchang; Marion Chilcott, for Adelaide. From New Westminster—J. M. Wetherwacks, for Nagasiki, Japan, 519,243 feet; Brunell, for Callao, 1,194,958 feet. From Vancouver—Clan Galbraith, for Algoa Bay, South Africa, 1,641,759 feet. From Cowichan—Fred J. Wood, for Santa Rosalio, South America, 180,400 feet. From Victoria—Alex. McNeil, for Port Pirie, Aus., 605,579 feet. From Ganges Harbor—Eric, for Tientsin, with piles.

The recent shipment of timber from the Hastings mill to Philadelphia, to be used in the construction of United States war vessels, will, it is believed, be followed by others. It is acknowledged that nowhere in the world can there be found as suitable timber for ship-building purposes as on the Pacific coast.

NOTES.

The Royal City Planing Mills recently shipped three car loads of lumber to England, via Montreal, to be used in the British navy.

Trail is to have a new saw mill. It will be erected by Mr. Thos. McKelvey, who has purchased timber limits across the river, back of what is known as East Trail.

The Kootenay Lumber Company, of Comaplix, B.C., purpose spending several thousand dollars in increasing the capacity of their mill and in putting in drying apparatus.

A new saw mill is being erected at Kamloops. McAlpine & Sucksmith are starting a saw mill at Grand Forks, and A. X. Fleming a sash and door factory at Columbia.

The Hastings Shingle Manufacturing Company, of Vancouver, report a brisk demand for shingles. Their four mills have a daily capacity of 600,000 shingles. I understand that the company are desirous of engaging some good shingle sawyers and packers.

The growth of the village of Columbia has induced Mr. G. O. Buchanan, the well known lumber operator of Kaslo, to start a branch there. I am told that a company will be formed, to be known as the Columbia River Lumber Company. The timber in the vicinity is mostly bull pine, though there is a large body of white pine up the north fork of the Kettle river.

## CANADIAN FORESTRY EXHIBIT.

THE work of selecting material for an exhibit of Canadian forest products at the Paris Exposition has been completed, and we are assured by those in charge that a creditable collection is the result. The exhibit, as our readers know, has been prepared by Mr. J. M. Macoun, assistant naturalist of the Geological Survey of Canada, which is a sufficient guarantee as to its completeness. Several of the provincial governments have assisted in procuring the necessary samples of merchantable timber, while exporters and manufacturers have also given valuable aid. In addition to the exhibit made by the different provinces the following have made entry:

John Heard & Co., St. Thomas—oak planks.

The Sutherland, Innes Co., Chatham—cooperage stock, staves, hoops, etc.

Gilmour & Co., Canoe Lake—one white pine deal.

The Menier Co., Anticosti—seven sections of trees and six deals.

W. H. Marcoun, Parry Sound—patent clothboards, basswood and elm veneer.

Kerr & Harcourt, Parry Sound—spools, bobbins and turned boxes.

John H. Grout, Grimsby—fruit baskets, boxes and walnut veneers.

The British American Timber Co., Kearney—birch deals.

Sir Henri Joly, Quebec—three sections of polished walnut trees.

Adam Beck, London—cigar boxes and stock and oak flooring.

The Columbia Handle & Lumber Co., St. Thomas—hockey sticks, golf sticks, etc.

North American Bent Chair Co,, Owen Sound—chair stock.

J. S. Findlay, Owen Sound—mangle rollers and beech flooring.

John Harrison, Owen Sound—butchers' skewers and stock.

Carl Zeidler, Toronto—various kinds of Canadian woods.

# THE NEWS.

—J. Bedard is building a saw mill at Windsor Mills, Que.

—A new saw mill has been built at Hornings Mills, Ont., by R. U. Irwin.

—William H. Hunting is building a new saw mill at Huntingville, Que.

—Arthur Wallace is starting business at Granby, Que., as a lumber dealer.

—James Kaizer, general store and lumber, Conquerall Bank, B. C., is dead.

—A new saw mill has been built at Norland, Ont., by Stephens & Argue.

—Brown & Lamb, lumber dealers, Orford, Que., have registered partnership.

—Jacob Lawrence & Sons are erecting a new saw and stave mill at Watford, Ont.

—P. Genelle & Co. are moving their lumber yard from Nelson to Greenwood, B. C.

—Charles Macpherson, of Orillia, Ont., is in the market for 10,000 cords of stave bolts.

—The firm of Wells & Smirl, saw mill owners, Central Park, B. C., has been dissolved.

—Gordon & Son, of Wallaceburg, Ont., will likely rebuild the Selkirk mill next spring.

—The general store aud saw mill of John Grant at Aberfeldy, Ont., is offered for sale.

—The Rathbun Company are reported to have purchased the Bronson saw mill at Bancroft, Ont.

—Frank Jones, of Kemptville, Ont., has invented a machine for the purpose of making boxes.

—The Collins Inlet Lumber Company have built a new boat, which is said to have cost about $12,000.

—James A. Kelley, of Vinton, Que., is building a saw mill on Bernard Creek, in the township of Litchfield.

—The Wicker-Work Manufacturing Company, Limited, Barrie, Ont., has been granted a provincial charter.

—The McKee Machinery & Lumber Co., of Ottawa, Limited, has been incorporated, with a capital of $15,000.

—The Magann-Fawke Lumber Company, Limited, has obtained an Ontario charter, with head office in Toronto.

—The Midland Box Shook & Planing Company have ately purchased the Cook property at Dollartown, Ont.

—Detroit capitalists are understood to have decided upon the erection of a large match factory at Windsor, Ont.

—Fulton Bros.' saw mill at Fingal, Ont., was destroyed by fire recently. The loss was $5,000, with no insurance.

—Bucknam Bros., of Severn Bridge, Ont., are reported to have purchased a timber limit in the vicinity of Whitney.

—W. J. Rhodes is about to erect a saw mill for custom work on the eighth concession of Raleigh, Kent county, Ont.

—W. F. Barnhill, of Fairville, N. B., has removed his shingle mill to Canterbury, where it will be operated all winter.

—A. McPherson & Company, of Longford Mills, Ont., have built a shingle mill about four miles south of Ravensworth.

—The incorporation is announced of the Yale Columbia Lumber Company, of Greenwood, B. C., with a capital of $500,000.

—H. F. Eaton & Sons have repaired one of their saw mills at Milltown, N. B., which has been closed down for two years.

—Goodwillie & Page, saw mill owners, Fonthill, Ont., have dissolved partnership, Mr. Goodwillie continuing the business.

—It is reported that a Lindsay firm has purchased a site at Norland, Ont., with the intention of erecting a water power saw mill.

—W. D. Mace, of Tamworth, Ont., has completed a new saw mill, fitted with machinery supplied by Madison Williams, of Port Perry, Ont.

—J. D. Sowerby, of Oak Bay, Que., is putting up a mill at Point Le Garde, and intends operating a rotary and two shingle machines.

—The Conger Lumber Company intend to thoroughly overhaul their mill at Parry Sound and to put in machinery of the latest design, including a band saw. Electric lighting will also be introduced.

—The Beaumont Mills Company, of Beaumont, N.W.T., has been incorporated, and will operate grist and saw mills. The capital is $4,000.

—It is understood that the mill of the Digby Manufacturing Company at Digby, N. S., which was destroyed by fire in October, will be rebuilt.

—The Laing-Ritchie Company, of Essex, Ont., have decided to establish a factory in Chatham. They manufacture handles and bent goods.

—T. F. Cockran and J. H. Stevens are building a flour mill at Edmundston, N. B., and it is reported that they intend putting in some shingle machines.

—The Victoria Harbor Lumber Company are said to have decided to erect a new saw mill this winter at Victoria Harbor, Ont., to contain two band saws.

—A saw mill at South River, Ont., formerly owned by the late S. McAdam, has been purchased by W. A. Connolly, who will run on custom work this winter.

—James Playfair & Company, of Midland, Ont., have purchased additional water frontage, and it is stated that a new saw mill will be erected on the property.

—The machine wood-workers in connection with the different saw mills and wood-working factories in Vancouver, B. C., are taking steps to form an association.

—The Parry Sound Lumber Company purpose making very extensive improvements to their mill at Parry Sound, and it is said that a wood-working factory may also be built.

—It is rumored that Munro & Ebert, who are now operating on the old Howry limit at Bay Finn, are considering the erection of a saw mill in the vicinity of Little Current, Ont., next year.

—The Hunting saw mill property at Huntingville, Que., has been purchased by F. Laroche & Company, of Coaticook. It is said that the new owners purpose putting in some pulp wood barkers.

—The new saw mill under construction at Kamloops, B. C., by John Shields will be completed at an early date. The mill will be two stories, 30 × 165 feet, with a capacity of 30,000 feet in ten hours.

—It is announced that McLaren & McLaurin, of East Templeton, Que., have bought a timber limit on the Coulonge river, and that they intend building a large addition to their saw mill this winter.

—Millers' Tanning Extract Co., of Millerton, N. B., make on an average 325 barrels of hemlock extract per week. Forty-five cords of hemlock bark are consumed daily in making the extract.

—J. J. Long, of Collingwood, and Alexander McDougall, of Duluth, are making arrangements to establish a modern ship-building plant at Collingwood. The ratepayers have been asked to grant a bonus of $50,000.

—Two cases of tamarac gum were recently shipped to England by Thos. Southworth, clerk of forestry for Ontario. If found satisfactory, it is expected that there will develop a considerable trade in this commodity.

—Negotiations are believed to be in progress between British importers and Canadian manufacturing firms looking to the manufacture on an extensive scale of broom handles, wash boards, etc., for the British market.

—The Department of Interior at Ottawa want bids by Monday, December 4th, for a license to cut timber on berth No. 867, comprising eight square miles adjacent to English Lake and Lake Winnipeg, in the province of Manitoba.

—G. A. White, A. E. Connell, J. S. Creighton, and John Donnelly, of Woodstock, and Geo. W. Upham, of Fredericton, have organized the Meduxnikik Lumber Co., Limited, with a capital of $10,000 and head office in Woodstock, N. B.

—T. A. Cuddy, of Minnedosa, Man., one of the most widely known retail lumber dealers in the west, has sold his lumber business at that place to J. F. Boyd. It is reported that Mr. Cuddy has purchased an interest in a lumber mill on the coast and will reside there in future.

—The Metegama Lumber Company, Limited, has been incorporated, with a capital of $100,000 and directors as follows: W. J. Sheppard, Waubaushene; Angus McLeod, Bracebridge; J. J. McNeil, Toronto; Geo. McCormack and T. H. Sheppard, Orillia. The head office will be in Orillia.

—The "White" mill of the Longford Lumber Company at Gravenhurst, Ont., was operated steadily this season from the 15th of July to the 31st of October, sawing 8,000,000 feet of lumber. The mill contains two Prescott band mills manufactured by the Wm. Hamilton Company, of Peterborough.

—Official reports sent out by the forestry division of the Department of Agriculture, the Mississippi Valley Lumberman says, show that the entire standing timber supply of the United States is in round numbers 2,300,000,000,000 feet, and that the annual cut is 40,000,000,000. Therefore, the entire lumber supply of the country will be extinct in fifty years. As about half of the whole supply is on the Pacific slope, all the available timber east of the Rocky Mountains will have vanished in about thirty years.

—Riendeau vs Chambly Manufacturing Company was a case heard in Superior Court at Montreal. The plaintiff was proprietor of a flour and saw mill at Richelieu, opposite Chambly, and alleged that the defendant had not furnished the power agreed upon, for which he claimed damages. The defendant pleaded that if the power was not furnished in time it was because the plaintff was not ready to receive it; further, that his building was too cold and that if he suffered loss and damage for want of the power which defendant could have furnished, the damages did not exceed $500. The court decided that plaintiff was entitled to the sum of $5,426,28, for which judgement was given.

## PERSONAL.

On October 25th the marriage took place of Capt. J. J. Sharples and Miss Florence White, of Quebec. The groom is a son of the late Chas. Sharples, and a nephew of Hon. John Sharples, M.P.P.

Mr. E. C. Grant, manager of the Ottawa Lumber Company, left for Europe on November 13th, sailing from New York by the steamer Oceanic. Mr. Grant will be absent until about the middle of January in the interests of the European business of his company.

Mr. J. W. Blair, of Orillia, who has been purchasing agent in Ontario for McCaffery & Farwell, of Oswego, buyers of telephone poles, has resigned his position, to become secretary of the Spanish River Pulp & Paper Co., a concern recently organized to build pulp and paper mills on the Spanish river.

Hon. J. A. Cockburn, Agent-General for the British colony of South Australia, was a recent visitor to Toronto. Mr. Cockburn attended the Trades Congress in Philadelphia, and came to Toronto with the view of advancing the commercial relations between the Antipodes and the Dominion. His place of residence is London, England, where he occupies an exactly similar position as the High Commissioner for Canada.

Mr. E. F. Stephenson, Dominion Crown Timber Agent, with headquarters at Winnipeg, has returned from the Yukon, where he went to inspect the Crown timber offices located at Dawson. Mr. Stephenson says that the government is pursuing the policy of reserving all timber upon gold-bearing streams for the use of miners. The timber is all spruce, and the logs run from 12 to 24 inches in diameter. Mr. Stephenson will make a report to the government.

## THE HASTINGS SHINGLE MANUFACTURING COMPANY.

A similarity of names caused us to refer in our October issue to the late Archibald McNair as head of the Hastings Shingle Manufacturing Company, of Vancouver, B.C. This was an error. The Hastings Shingle Manufacturing Company is composed of Messrs. James A. McNair and Robert McNair. The company are manufacturers of red cedar shingles, lumber, etc., with mills at Vancouver and Hastings, in British Columbia, and at New Whatcom and Goshen, in Washington. The daily shingle capacity is 600,000, and the dry kiln shingle capacity 6,000,000. The head office of the company is at 432 Westminster avenue, Vancouver. The late Archibald McNair had but one mill, located at Hastings, B.C.

The November Cosmopolitan will bring pleasant recollections to the millions who saw the recent Dewey celebrations in New York, and will give other millions the first adequate idea of those remarkable days. It contains a very fine collection of pictures of scenes in the metropolis when the Admiral was welcomed home.

## TRADE NOTES.

The Lillie foundry at Perth, Ont., has passed into the hands of the James Bros. Foundry Company.

The Ottawa Saw Works Company are introducing new capital into their business. A joint stock company will be formed, and in all probability new works will be erected in Hull.

The Lloyd Manufacturing Co., of Kentville, N.S., have shipped a saw mill outfit to the Indian Reserve Agency, North-west Territory. Trial shipments of saw-milling machinery are in prospect to Newfoundland and Australia.

The Waterous Company, of Brantford, last month shipped to the Keewatin Lumber Company, at Keewatin, Ont., a No. 3 Allis band mill, with No. 2 Reliance log carriage, four head blocks, and a No. 1 extra heavy friction feed works.

Mr. James W. Woods, manufacturer and agent for lumbermen's supplies, Ottawa, has decided to erect a five story building in that city. The basement will be used as a store room for heavy goods and the offices and show rooms will be situated on the first floor, while the second and third will be used for storage purposes. The fourth and fifth stories will be fitted up as a factory.

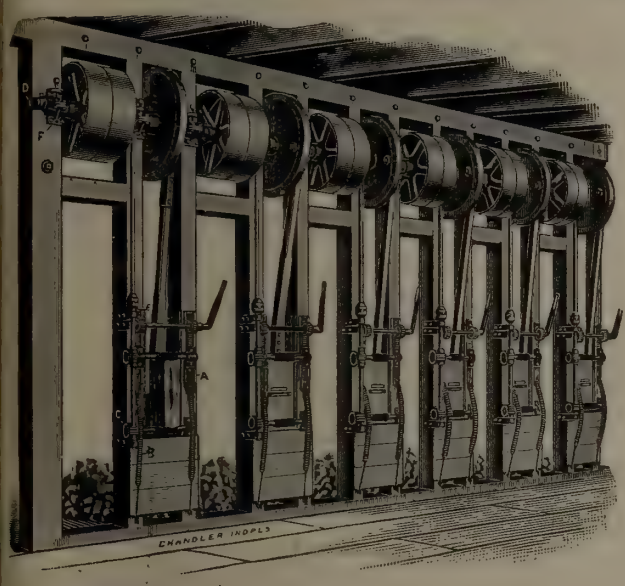
We were pleased to notice above the entrance to No. 30 Wellington street east, Toronto, a sign bearing the familiar name of F. E. Dixon & Co. Enquiry elicited the fact that Mr. F. E. Dixon, who was for many years engaged in the manufacture of leather belting in Toronto, has resumed business in the same line. The firm have been appointed agents for Messrs. S. E. Norris & Co., manufacturers of leather and leather belting, London, Eng. (established 1775). Mr. Dixon reports that some of his old customers have already found their way back to him, and he hopes to see others, in addition to many new ones.

A recent issue of the Galt Reformer contains an account of an oyster supper tendered to their employees by Messrs. James Warnock & Co., of that town, the well known manufacturers of lumbermen's axes, cant hooks, peevies, etc. The event is regarded as one of the most significant which has taken place in that town, marking the cordial relations existing between capital and labor. Fifty-five years ago the business was established. It is now one of the most progressive in Canada, employing about one hundred hands, some of whom have been in the employ of the company thirty years, and many of them over twenty years. Mr. James Warnock, the head of the firm, died last year, and the business of the firm was placed in the hands of Mr. F. H. Hayhurst.

## "WANTED AND FOR SALE."

Persons having for sale or wishing to purchase a particular lot of lumber, a mill property, timber limits, second hand machinery, etc., in fact, anything pertaining to lumbering operations, will find a buyer or seller, as the case may be, by placing an advertisement in the "Wanted and For Sale Department" of the CANADA LUMBERMAN Weekly Edition. Testimonials to the value of this department by those who have given it a trial state that the results of advertisements were frequently better than anticipated. The cost is comparatively small. Mill owners might, with profit to themselves, make use of this method of advertising their stock to a still greater extent.

# The Best Excelsior Machine in the World



When two or more knives are run with one belt, all must stop when the belt is stopped to set bits or from any other cause. Our Machine has a belt for each knife, hence but one knife stops at a time. This great advantage should not be overlooked by purchasers. Time is money. Our Machine cuts more excelsior in a given time than any other machine. Get our circulars and prices.

# WOOD PULP DEPARTMENT

## MACHINERY FOR PULP MILLS.

WITH the development of the pulp industry in Canada there has arisen much interest in the question of mill equipment, and the relative merits of Canadian and United States machinery have been discussed. The Paper Mill, of New York, contends that for machinery to equip pulp mills, and for structural material for the building of such mills, Canada is almost dependent on the United States, and that the advance in the prices of iron and steel has been so great that the cost of structural material and machinery has been greatly advanced. This journal states that the new mills cannot be built in Canada at present nearly as cheap as they could have been built six months or a year ago, and that if erected they could not compete with some of the older mills which were built with less money.

The statement as to the increased cost of building pulp mills is probably in a measure correct, but that Canada is dependent upon the United States for machinery with which to build pulp mills is a statement to which we take exception. As a proof, we might point to the Masterman pulp mill at Chatham, N.B., which was built entirely of machinery manufactured in Canada. There are several large and responsible firms engaged in the manufacture of pulp machinery, and to some of these the CANADA LUMBERMAN submitted the statements published in the Paper Mill. Their replies will be found below :

AMHERST, N.S., Nov. 15, 1899.

DEAR SIRS,—We do not think it is correct that Canada is almost entirely dependent, or to any extent dependent, upon the United States for pulp machinery, as there are a large number of concerns making this class of machinery in Canada. The large increase in the cost of iron and steel materials will no doubt increase the cost to some extent, especially for sulphite mills, which use large digestors, etc., made of heavy boiler plate, which has about doubled in price.

The machines for mechanical pulp making have not increased in cost to any great extent. We manufacture grinders, wet machines, etc., suitable for mechanical pulp, and have not increased the price more than perhaps 10 or 15 per cent.

Yours truly,
ROBB ENGINEERING COMPANY.

---

LONDON, CANADA, Nov. 14th, 1899.

DEAR SIRS,—Yours of the 11th instant to hand, in reference to pulp mill machinery. We are only interested in the manufacture of pulp digestors, such as shown by blue print enclosed, having made several of them for the Dominion Pulp Co., Chatham, N.B.

Yours truly,
E. LEONARD & SONS.

---

TORONTO, ONT., Nov. 22nd, 1899.

DEAR SIRS,—With regard to the subject matter of your letter we may say that the word "machinery" is a very large one, as a pulp mill equipment includes a very large variety of different items of machinery. We presume that your enquiry has particular reference to the pulp mill machinery that we manufacture, and from this standpoint we shall be very glad to go into details.

With reference to the general subject, we may say that so far as we are aware, several firms in Canada are now manufacturing a considerable portion of the pulp mill machinery, and we may mention among these : The Wm. Hamilton Mfg. Co., Peterborough ; John Bertram & Son, Dundas ; and the Waterous Engine Works Co., Brantford.

As to the advance in price of iron and steel causing an increase in the cost of such machinery, that is undoubtedly true, but that this cost has arrested the tendency to proceed with the proposed pulp mill projects is not, we think, a well founded statement. In this particular, our general lines have been advanced in prices from 10 to 15 per cent., owing to the advance in cost of both labor and material, as the price of pig iron, bar iron and other raw material has practically doubled in the last few months.

Yours truly,
THE NORTHEY MFG. CO., Limited.

SHERBROOKE, QUE., Nov. 15, 1899.

DEAR SIRS,—We do not agree with the statement quoted, viz., that for machinery to equip pulp mills Canada is almost entirely dependent upon the United States. A mill for the production of ground wood pulp can be entirely equipped by means of Canadian-made machinery, the only items necessary to procure from the United States being the stones for the grinders. Within the past three weeks we have prepared specifications for two ground wood mills, and with the exception of the stones for grinders as mentioned, every item will be built in Canada, or the product of Canadian firms.

It is true that for the latest practice in these lines we depend somewhat upon our observation of American methods, and some of the machines are built by us under the rights of American patentees and in strict accordance with plans furnished by them, but this does not alter the fact that it is possible to build a mill in Canada and equip it entirely with Canadian-made machinery ; in fact, we think the Canadian paper trade, as well as the pulp manufacturers, have abundant opportunity for putting the matter to the test, as pulp mill machinery is manufactured to a greater or less extent by the following Canadian firms : John Bertram & Sons, Waterous Company, E. Leonard & Sons, Robb Engineering Co., Carrier, Laine & Co. I. Matheson & Co., Richard Smith, Polson Co., and there may be some others that escape our notice at the moment, who are engaged in this line of manufacture, in addition to ourselves.

With regard to soda pulp mills the foregoing holds good, but with sulphite mills the case is somewhat different, although in the main the statement holds good. With the exception of some of the patented digestor linings and special apparatus in connection with sulphite plants, the bulk of the items of plant for such equipments is manufactured in Canada, or will be built to specification by Canadian manufacturers. In cases under observation where machinery for pulp mills has been procured from the United States, it has seemed to us more the result of the influence of American directors of the companies concerned than any great difference in the merits of Canadian and American machinery.

The cost of materials has compelled an increase of prices ranging from 10 to 25 per cent. or more on all classes of machinery, but in our observation it has not resulted in any postponement or deferring of proposed pulp mill projects in this country. We have as many inquiries and orders under way in this branch as we had a year or so ago, if not more, and the tendency seems to be to place orders for immediate construction in anticipation of a further rise in the price of materials.

With reference to late improvements in machinery, we might refer to the new type of grinder made in the United States by the Ticonderoga Machine Works, Ticonderoga, N.Y., under the name of the Cedar Point Foundry Pattern, and by us in Canada under the name of the Port

GEO. T. HOUSTON & CO.
CHICAGO, ILLS., U.S.A.

Henry grinder. Our American friends advise us of some very large orders filled by them for the International Paper Company, the latter company having adopted it for their new mills in various parts of the United States. We have also made improvements in the various details of our screens, presses and other machines, and increased our facilities for production. As regards power plants for this class of service, we have a large number of Croker patent turbines installed and giving very satisfactory results in pulp and paper mill work throughout Canada, and are prepared to contract for the entire equipment of ground wood pulp mills, including the buildings, when necessary, erected and fitted, ready for operation.

On the whole, we feel there is no good reason why Canadian pulp mill men should go outside of Canada for any portion of their equipment, so long as the facilities for obtaining machinery of latest design and thorough construction are so numerous as at present. Nearly every portion of Ontario and Quebec, as well as the lower provinces, are within easy shipping distance of some firm making this class of work a specialty to a greater or less extent.

Yours truly,

THE JENCKES MACHINE COMPANY.

**The above letters, we think, prove that there can be obtained in Canada first-class machinery for the equipment of pulp mills, and wherever machinery can be obtained at home of equal quality to that produced in foreign countries, the home industries should be given the preference.**

## BRITISH IMPORTS OF PULP.

FOR the nine months ending September 30th, 1899, Great Britain imported 116,164 tons of mechanical wood pulp from Norway, 29,431 tons from Canada, 1,624 tons from Sweden, 694 tons from United States, and 3,795 tons from other countries. The total is 164,708 tons, and the value £411,918, or about $12 per ton. It will be seen that Norway practically monopolizes the British market in mechanical pulp, although Canada is gradually forging ahead. Chemical pulp was imported into Great Britain during the corresponding period to the extent of 146,544 tons, of the value of £1,042,548, or about $35 per ton. From Norway there were received 67,014 tons, and from Sweden 55,623 tons, all the other countries sending less than 26,000 tons. The shipments from Canada of chemical pulp, as compared with 1898, show a decline.

E. A. Bremner, managing director of the Imperial Paper Mills Company, Sturgeon Falls, Ont., is now on a visit to England.

## EXTENSIVE PULP MILL FOR CANADA.

FOR some time it has been known that the Edward Lloyd Company, Limited, of London, England, have been looking to Canada as a promising field for exploitation. It is now reported that they have decided upon their venture, and that an extensive pulp mill will be erected on a site yet to be selected. The project is in the hands of Mr. John C. Morgan, of Niagara Falls, N.Y., who resigned as representative of the International Paper Company to accept this commission.

The company is understood to have options on four sites in Canada, two in the lower provinces, one north of Niagara Falls, and another further west. Mr. Morgan states that it is the intention at the inception to build a mill capable of turning out from 100 to 200 tons of pulp per day, and that water power of 50,000 horse power is required. It has been stated that the machinery for the mill has been ordered, but this report is denied. Early next spring it is expected that Mr. Frank Lloyd and his confidential agent, Mr. Neil Turner, will visit Canada for the purpose of completing final arrangements for the building of the mill.

## PULP NOTES.

The Jonquier Pulp Company, of St. Dominique Jonquier, Que., has been incorporated, with a capital of $40,000, to manufacture pulp and paper.

The Royal Paper Mills Company, of East Angus, Que., have decided to increase the capacity of their pulp mill, having put in two additional digestors and two new steam boilers.

The St. John Sulphite Fibre Company, of St. John, N.B., have closed a contract with an American paper manufacturer to supply 2,000 tons of pulp, to be delivered next season.

The ratepayers of Shipton have voted in favor of granting a bonus of $10,000 to A. J. Morrill, of Nicolet Falls, Que., to assist in building a pulp mill. Mr. Morrill owns a water power with 55 feet head.

It is now stated that British capitalists are interested in the proposal to build a pulp mill in the Ottawa valley. It is said that the mill will be located in the neighborhood of Chelsea or Ironsides, on the Upper Gatineau, and that the machinery has already been ordered, but this latter report is not confirmed.

It is reported that an English house has made contracts in Nova Scotia for the supply of 25,000 tons of pulp, to be delivered next year. There seems little fear of the pulp industry in Canada being overdone, as it is said that the present output of pulp in Canada does not represent over three per cent. of the total requirement of Great Britain.

A number of the citizens at St. Gedeon, St. Bruno and Nebertsville, Que., are considering the advisability of forming a company to build a pulp mill on the Belle Riviere.

It is reported on reliable authority that land has been purchased on the Capilano river, near Vancouver, B.C., on which to build a large pulp mill, and that the timber on the Capilano Park Company's property has been sold to the projectors of the enterprise.

The Sissiboo Pulp & Paper Company, Limited, have taken over the mill of the Sissiboo Falls Pulp Company and purchased some 20,000 acres of timber land on the Sissiboo river and its tributaries in Nova Scotia. It is the intention to at once construct a dam at Sissiboo Falls and erect another pulp mill large enough to bring the combined output of the two mills up to 12,000 tons of dry pulp per year. Mechanical pulp will be manufactured. Both mills will be connected by an electric railway with the tidal waters of the Bay of Fundy at Weymouth Bridge, where there are good loading berths with 18 feet of water. Chas. Burrill, of Weymouth, N.S. is the promoter of this project.

A company has obtained from the Ontario government a concession of 2,000 acres of Crown land in the townships of Dungannon, Monteagle, Carlaw, Raglan and Brudenell, along the Madawaska river. This property is said to be rich in corundum, and the company agree to spend $100,000 in development work within the next three years. It is expected that a market for the corundum will be furnished by the pulp industry, which will use the mineral in the form of grindstones. Corundum is said to be superior to all other abrasives for use in pulp mills, but the great cost has in the past precluded its use, $70 per ton being about the current value. But according to the Danish expert engaged by the above company, a plan has been devised by which it can be produced in the Madawaski district for $14 per ton.

Incorporation has just been granted to the Spanish River Pulp & Paper Company, Limited, with a capital of $1,500,000 and head office in the city of Toronto. The company is composed of: W. J. Sheppard, Coldwater; T. H. Sheppard, Orillia; John J. McNeil, Toronto; Geo. McCormick, M.P., Uptergrove; Wm. Irwin, Peterboro'; Chas. McCool, Ottawa; James Playfair, Midland; Wm. Lummis, Spragge; Marshall J. Dodge, New York; Angus McLeod, Bracebridge; and A. R. Creelman, Toronto. A valuable water power on the Spanish River has been acquired, and at this point it is proposed to build large paper and pulp mills. It is expected that contracts will be awarded at an early date for mill construction and plant, although active work may not be commenced before the early spring. Judging by the personnel of the company, this project gives promise of developing into one of the most extensive pulp and paper industries in Canada.

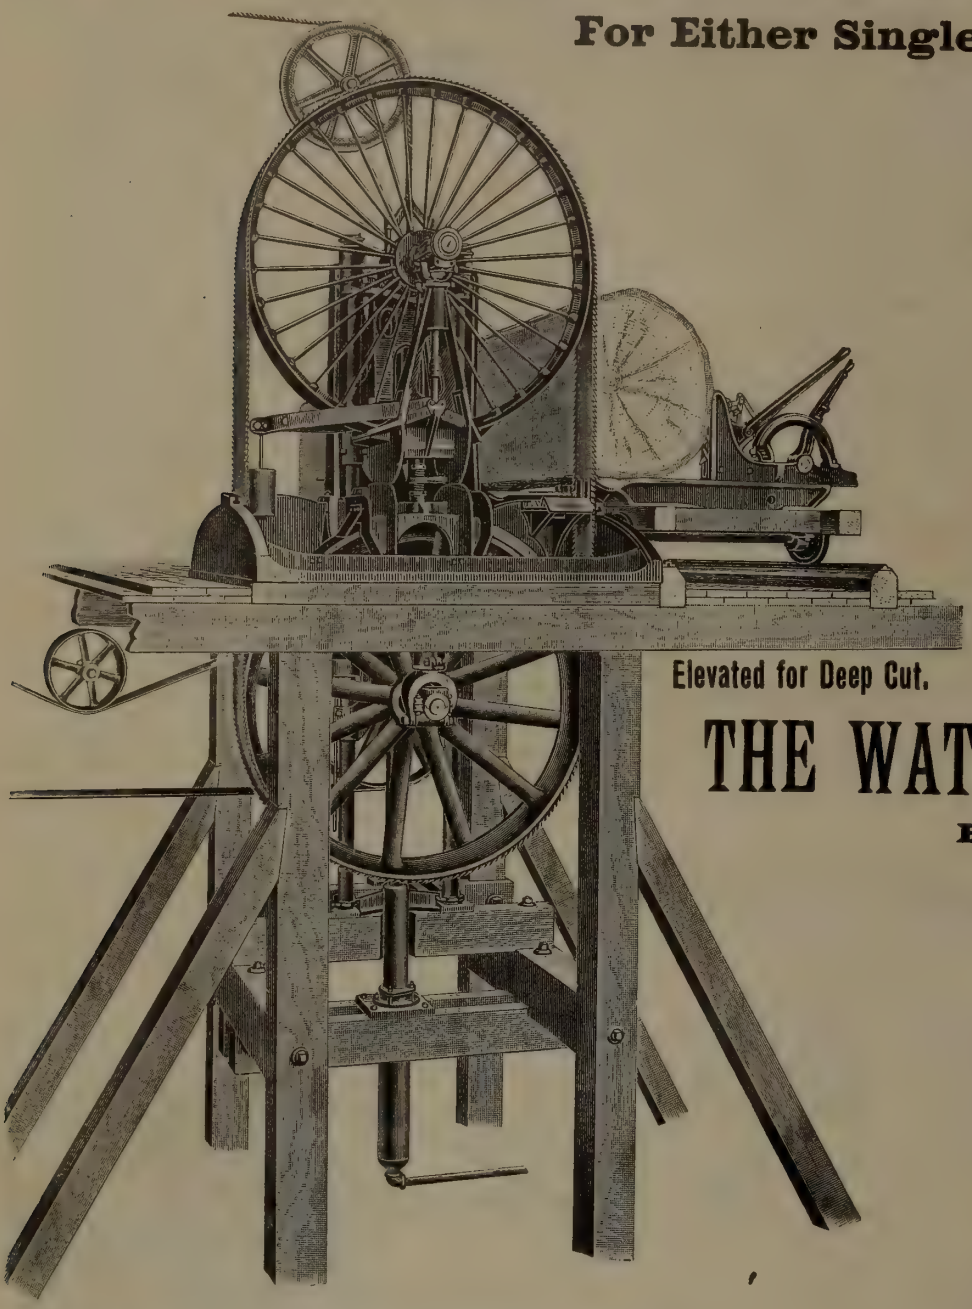
# New Allis Telescopic Band Mill

## For Either Single or Double Toothed Saws

Is built on correct mechanical principles.

This entire mill is moved vertically, so that the centre of the upper band wheel can be brought down close to the top of the smallest log, thereby having a saw shorter than a gang saw above the work on any sized log, thus doing away with upper guide.

The vertical movement keeps the surplus length of saw blade below instead of above the log. The upper wheel acting as the guide, insures the greatest possible rigidity of the saw, enabling the saw to stand more feed than on the ordinary band mill.



Elevated for Deep Cut.

Manufactured in Canada only by

## THE WATEROUS ENGINE WORKS CO.

BRANTFORD, CANADA

Lowered for Narrow 12" Cut.

## As a Double Cutting Mill

**No Offset**—carriage travels at uniform speed each way, saving rack and strain.

**Safer**—each side of saw cuts its own clearance.

**Smoother** lumber; teeth not cutting almost plane the lumber in passing.

**Saws**—last longer, require less work to keep in order—strain being equal on both edges.

**Increased Cut**—30 to 50% with practically no additional cost.

Adjustment to depth of cut quicker than operating the old guide.

J. D. Shier, Bracebridge, Ont., has run this mill as a double cutter night and day all season, and verifies the above statements. He is more than pleased, says no one can afford to cut lumber with any other mill.

The Rat Portage Lumber Co., Norman, Ont., have run it as a single cutter all season, and are especially well pleased.

PLEASE NOTE.—Our capacity is limited—even with increased facilities and very much larger force—we have been and are running to our utmost capacity. Prices are advancing in sympathy with the large and steady increase in raw materials.

To obtain earliest delivery—probably then later than desired—orders should be placed at once. Some recognizing this have already ordered Telescopic Bands for next year's work.

## This Saw Stands Without a Rival

AND IS THE

**FASTEST CUTTING SAW IN THE WORLD!**

Its Superiority consists in its Excellent Temper. It is made of "Razor Steel," which is the finest ever used in the manufacture of Saws. We have the sole control of this steel. It is tempered by our secret process, which process gives a keener cutting edge and a toughness to the steel which no other process can approach.

## Maple Leaf Saw Set

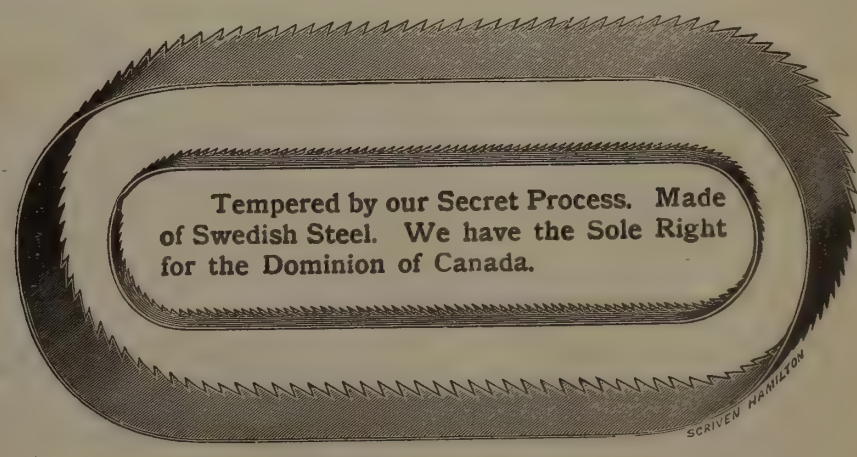
MANUFACTURED BY

**SHURLY & DIETRICH, Galt, Ont.**

**Directions.**—Place the set on the point of tooth, as shown in the accompanying cut, and strike a very light blow with a tack hammer. If you require more set, file the tooth with more bevel.

If you follow directions you cannot make a mistake Be sure and not strike too hard a blow, and it will set the hardest saw. **On receipt of 40 cents we will send one by mail.**

We are the only manufacturers in the world who export Saws in large quantities to the United States.



We Manufacture

# HIGH GRADE BAND SAWS

of All Widths and Lengths.

These Saws are made of Refined Swedish Steel imported direct, and tempered by our Secret Process; for Fine Finish and Temper are not excelled.
